10 Field of the Invention

This invention relates to a novel group of pyrazole compounds, compositions and methods for treating p38 kinase mediated disorders.

15 Background of the Invention

20 Mitogen-activated protein kinases (MAP) is a family of proline-directed serine/threonine kinases that activate their substrates by dual phosphorylation. The kinases are activated by a variety of signals including nutritional and osmotic stress, UV light, growth factors, endotoxin and inflammatory cytokines. The p38 MAP kinase group is a MAP family of various isoforms, including p38 α , p38 β and p38 γ , and is responsible for phosphorylating and activating transcription factors

25 (e.g. ATF2, CHOP and MEF2C) as well as other kinases (e.g. MAPKAP-2 and MAPKAP-3). The p38 isoforms are activated by bacterial lipopolysaccharide, physical and chemical stress and by pro-inflammatory cytokines, including tumor necrosis factor (TNF- α) and interleukin-1

30 (IL-1). The products of the p38 phosphorylation mediate the production of inflammatory cytokines, including TNF and IL-1, and cyclooxygenase-2.

TNF- α is a cytokine produced primarily by activated monocytes and macrophages. Excessive or unregulated TNF

35 production has been implicated in mediating a number of diseases. Recent studies indicate that TNF has a

FOC-03-0001

causative role in the pathogenesis of rheumatoid arthritis. Additional studies demonstrate that inhibition of TNF has broad application in the treatment of inflammation, inflammatory bowel disease, multiple sclerosis and asthma.

TNF has also been implicated in viral infections, such as HIV, influenza virus, and herpes virus including herpes simplex virus type-1 (HSV-1), herpes simplex virus type-2 (HSV-2), cytomegalovirus (CMV), varicella-zoster virus (VZV), Epstein-Barr virus, human herpesvirus-6 (HHV-6), human herpesvirus-7 (HHV-7), human herpesvirus-8 (HHV-8), pseudorabies and rhinotracheitis, among others.

IL-8 is another pro-inflammatory cytokine, which is produced by mononuclear cells, fibroblasts, endothelial cells, and keratinocytes, and is associated with conditions including inflammation.

IL-1 is produced by activated monocytes and macrophages and is involved in the inflammatory response. IL-1 plays a role in many pathophysiological responses including rheumatoid arthritis, fever and reduction of bone resorption.

TNF, IL-1 and IL-8 affect a wide variety of cells and tissues and are important inflammatory mediators of a wide variety of disease states and conditions. The inhibition of these cytokines by inhibition of the p38 kinase is of benefit in controlling, reducing and alleviating many of these disease states.

Various pyrazoles have previously been described. U.S. Patent No. 4,000,281, to Beiler and Binon, describes 4,5-aryl/heteroaryl substituted pyrazoles with antiviral activity against both RNA and DNA viruses such as myxoviruses, adenoviruses, rhinoviruses, and various viruses of the herpes group. WO 92/19615, published November 12, 1992, describes pyrazoles as novel fungicides. U. S. Patent No. 3,984,431, to Cueremy and Renault, describes derivatives of pyrazole-5-acetic acid

83/00330, published February 3, 1983, describes a new process for the preparation of diphenyl-3,4-methyl-5-pyrazole derivatives. WO 95/06036, published March 2, 1995, describes a process for preparing pyrazole derivatives. US patent 5,589,439, to T. Goto, et al., describes tetrazole derivatives and their use as herbicides. EP 515,041 describes pyrimidyl substituted pyrazole derivatives as novel agricultural fungicides. Japanese Patent 4,145,081 describes pyrazolecarboxylic acid derivatives as herbicides. Japanese Patent 5,345,772 describes novel pyrazole derivatives as inhibiting acetylcholinesterase.

U.S. Patent No. 5,559,137 to Adams et al, describes novel pyrazoles (1,3,4,-substituted) as inhibitors of cytokines used in the treatment of cytokine diseases. Specifically, 3-(4-fluorophenyl)-1-(4-methylsulfinylphenyl)-4-(4-pyridyl)-5H-pyrazole is described. WO 96/03385, published February 8, 1996,

describes 3,4-substituted pyrazoles, as having anti-

inflammatory activity. Specifically, 3-methylsulfonylphenyl-4-aryl-pyrazoles and 3-aminosulfonylphenyl-4-aryl-pyrazoles are described.

Laszlo et al., Bioorg. Med. Chem. Letters, 8 (1998) 2689-2694, describes certain furans, pyrroles and pyrazolones, particularly 3-pyridyl-2,5-diaryl-pyrroles, as inhibitors of p38 kinase.

The invention's pyrazolyl compounds are found to show usefulness as p38 kinase inhibitors.

As used herein, the term "TNF mediated disorder"

refers to any and all disorders and disease states in which TNF plays a role, either by control of TNF itself, or by TNF causing another monokine to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to TNF, would therefore be considered a disorder mediated by TNF.

As used herein, the term "p38 mediated disorder" refers to any and all disorders and disease states in which p38 plays a role, either by control of p38 itself, or by p38 causing another factor to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to p38, would therefore be considered a disorder mediated by p38.

As TNF- β has close structural homology with TNF- α (also known as cachectin) and since each induces similar biologic responses and binds to the same cellular receptor, the synthesis of both TNF- α and TNF- β are inhibited by the compounds of the present invention and thus are herein referred to collectively as "TNF" unless specifically delineated otherwise.

The "hydrocarbon" moieties described herein are organic compounds or radicals consisting exclusively of the elements carbon and hydrogen. These moieties also include alkyl, alkenyl, alkynyl, and aryl moieties substituted with other aliphatic or cyclic hydrocarbon groups, such as alkaryl, alkenaryl and alkynaryl. Preferably, these moieties comprise 1 to 20 carbon atoms.

The heterosubstituted hydrocarbon moieties described herein are hydrocarbon moieties which are substituted with at least one atom other than carbon, including moieties in which a carbon chain atom is substituted with a hetero atom such as nitrogen, oxygen, sulfur, or a halogen atom. These substituents include lower alkoxy such as methoxy, ethoxy, butoxy; halogen such as chloro or fluoro; ethers; acetals; ketals; esters; heterocyclyl such as furyl or thienyl; alkanoxy; hydroxy; protected hydroxy; acyl; acyloxy; nitro; cyano; amino; and amido.

The additional terms used to describe the substituents of the pyrazole ring and not specifically defined herein are defined in a similar manner to that illustrated in the above definitions. As above, more preferred substituents are those containing "lower" radicals. Unless otherwise defined to contrary, the term "lower" as used in this application means that each alkyl radical of a pyrazole ring substituent comprising one or more alkyl radicals has one to about six carbon atoms; each alkenyl radical of a pyrazole ring substituent comprising one or more alkenyl radicals has two to about six carbon atoms; each alkynyl radical of a pyrazole ring substituent comprising one or more alkynyl radicals has two to about six carbon atoms; each cycloalkyl or cycloalkenyl radical of a pyrazole ring substituent comprising one or more cycloalkyl and/or cycloalkenyl radicals is a 3 to 8 membered ring cycloalkyl or

cycloalkenyl radical, respectively; each aryl radical of a pyrazole ring substituent comprising one or more aryl radicals is a monocyclic aryl radical; and each heterocyclyl radical of a pyrazole ring substituent comprising one or more heterocyclyl radicals is a 4-8 membered ring heterocyclyl.

The present invention comprises the tautomeric forms of compounds of Formulae I and IX (as well as the compounds of Formulae (IA and IXA)). As illustrated below, the pyrazoles of Formula I and I' are magnetically and structurally equivalent because of the prototropic tautomeric nature of the hydrogen:

The present invention also comprises compounds of Formula I, IA, IX, IXA, X, XA and XI having one or more asymmetric carbons. It is known to those skilled in the art that those pyrazoles of the present invention having asymmetric carbon atoms may exist in diastereomeric, racemic, or optically active forms. All of these forms are contemplated within the scope of this invention. More specifically, the present invention includes enantiomers, diastereomers, racemic mixtures, and other mixtures thereof.

The present invention comprises a pharmaceutical composition for the treatment of a TNF mediated disorder, a p38 kinase mediated disorder, inflammation, and/or arthritis, comprising a therapeutically-effective amount

of a compound of Formula I and/or IA, or a therapeutically-acceptable salt or tautomer thereof, in association with at least one pharmaceutically-acceptable carrier, adjuvant or diluent.

The present invention further encompasses substituted pyrazoles that specifically bind to the ATP binding site of p38 kinase. Without being held to a particular theory, applicants hypothesize that these substituted pyrazoles interact with p38 kinase as set forth below. As the substituent at the 3-position of the pyrazole ring approaches the ATP binding site of p38 kinase, a hydrophobic cavity in the p38 kinase forms around the 3-position substituent at the binding site. This hydrophobic cavity is believed to form as the 3-position substituent binds to a specific peptide sequence of the enzyme. In particular, it is believed to bind to the sidechains of Lys₅₂, Glu₆₉, Leu₇₃, Ile₈₂, Leu₈₄, Leu₁₀₁ and the methyl group of the Thr₁₀₃ sidechain of p38 kinase at the ATP binding site (wherein the numbering scheme corresponds to the numbering scheme conventionally used for ERK-2). Where the 3-position substituent is aryl or heteroaryl, such aryl or heteroaryl may be further substituted. It is hypothesized that such ring substituents may be beneficial in preventing hydroxylation or further metabolism of the ring.

The substituent at the 4-position of the pyrazole ring is one that is a partial mimic of the adenine ring of ATP, although it may be further elaborated. Preferably, it is a planar substituent terminated by a suitable hydrogen bond acceptor functionality. It is hypothesized that this acceptor hydrogen bonds to the backbone N-H of the Met₁₀₆ residue while one edge of this substituent is in contact with bulk solvent.

Substitution at the 5-position of the pyrazole ring is well tolerated and can provide increased potency and selectivity. It is hypothesized that such substituents

100480-100480

extend out in the direction of the bulk solvent and that suitable polar functionality placed at its terminus can interact with the sidechain of Asp¹⁰⁹, leading to increased potency and selectivity.

Similarly, substitution on the nitrogen atom at the 1- or 2-position of the pyrazole ring is well tolerated and can provide increased potency. It is hypothesized that a hydrogen substituent attached to one of the ring nitrogen atoms is hydrogen bonded to Asp₁₆₅. Preferably, the nitrogen atom at the 2-position is double bonded to the carbon atom at the 3-position of the pyrazole while the nitrogen atom at the 1-position of the pyrazole is available for substitution with hydrogen or other substituents.

The 5-position substituent and the 1- or 2-position substituent of the pyrazole can be selected so as to improve the physical characteristics, especially aqueous solubility and drug delivery performance, of the substituted pyrazole. Preferably, however, these substituents each have a molecular weight less than about 360 atomic mass units. More preferably, these substituents each have a molecular weight less than about less than about 250 atomic mass units. Still more preferably, these substituents have a combined molecular weight less than about 360 atomic mass units.

A class of substituted pyrazoles of particular interest consists of those compounds having the formula:

wherein

R¹ is a hydrocarbyl, heterosubstituted hydrocarbyl or heterocyclyl radical having a molecular weight less than about 360 atomic mass units; and

R² is a hydrocarbyl, heterosubstituted hydrocarbyl or heterocyclyl radical that binds with p38 kinase at said ATP binding site of p38 kinase; and

R³ is a hydrocarbyl, heterosubstituted hydrocarbyl or heterocyclyl radical having a hydrogen bond acceptor functionality; and

R⁴ is a hydrocarbyl, heterosubstituted hydrocarbyl or heterocyclyl radical having a molecular weight less than about 360 atomic mass units;

provided R³ is not 2-pyridinyl when R⁴ is a phenyl ring containing a 2-hydroxy substituent and when R¹ is hydrido; further provided R² is selected from aryl, heterocyclyl, unsubstituted cycloalkyl and cycloalkenyl when R⁴ is hydrido; and further provided R⁴ is not methylsulfonylphenyl; or

a pharmaceutically-acceptable salt or tautomer thereof.

In this embodiment of the invention, one or more of R¹, R², R³ and R⁴ preferably are selected from the corresponding groups of the compounds of Formula I and/or IA. More preferably, R³ is an optionally substituted pyridinyl or pyrimidinyl, R⁴ is a halo substituted phenyl, and R¹ and R² have the definitions set forth immediately above.

The present invention also is directed to the use of the compounds of Formula I and/or IA in the preparation of medicaments useful in the treatment and/or prophylaxis of p38 kinase mediated conditions and disorders.

Also included in the family of compounds of Formulae I and/or IA are the pharmaceutically-acceptable salts and prodrugs thereof. The term "pharmaceutically-acceptable salts" embraces salts commonly used to form alkali metal salts and to form addition salts of free acids or free bases. The nature of the salt is not critical, provided that it is pharmaceutically-

acceptable. Suitable pharmaceutically-acceptable acid addition salts of compounds of Formulae I and/or IA may be prepared from an inorganic acid or from an organic acid. Examples of such inorganic acids are hydrochloric, hydrobromic, hydroiodic, nitric, carbonic, sulfuric and phosphoric acid. Appropriate organic acids may be selected from aliphatic, cycloaliphatic, aromatic, araliphatic, heterocyclyl, carboxylic and sulfonic classes of organic acids, example of which are formic, acetic, propionic, succinic, glycolic, gluconic, lactic, malic, tartaric, citric, ascorbic, glucuronic, maleic, fumaric, pyruvic, aspartic, glutamic, benzoic, anthranilic, mesylic, stearic, salicylic, p-hydroxybenzoic, phenylacetic, mandelic, embonic (pamoic), methanesulfonic, ethanesulfonic, benzenesulfonic, pantothenic, toluenesulfonic, 2-hydroxyethanesulfonic, sulfanilic, cyclohexylaminosulfonic, algenic, β -hydroxybutyric, galactaric and galacturonic acid. Suitable pharmaceutically-acceptable base addition salts of compounds of Formula I and/or IA include metallic salts and organic salts. More preferred metallic salts include, but are not limited to appropriate alkali metal (group Ia) salts, alkaline earth metal (group IIa) salts and other physiological acceptable metals. Such salts can be made from aluminum, calcium, lithium, magnesium, potassium, sodium and zinc. Preferred organic salts can be made from tertiary amines and quaternary ammonium salts, including in part, tromethamine, diethylamine, N,N'-dibenzylethylenediamine, chlorprocaine, choline, diethanolamine, ethylenediamine, meglumine (N-methylglucamine) and procaine. All of these salts may be prepared by conventional means from the corresponding compound of Formulae I and/or IA by reacting, for example, the appropriate acid or base with the compound of Formulae I and/or IA.

The present invention additionally comprises a class

10024780-120701

of compounds defined by Formula XX:

(XX)

wherein R³ and R⁴ are as defined for the compounds of Formulae I and/or IA. Also included in the family of compounds of Formula XX are the pharmaceutically-acceptable salts and prodrugs thereof.

The compounds of Formula XX are useful as intermediates in the preparation of the compounds of Formulae I and/or IA. In addition, the compounds of Formula XX themselves have been found to show usefulness as p38 kinase inhibitors. These compounds are useful for the prophylaxis and treatment of the same p38 kinase mediated disorders and conditions as the compounds of formulae I and/or IA. Accordingly, the present invention provides a method of treating a cytokine-mediated disease which comprises administering an effective cytokine-interfering amount of a compound of Formula XX or a pharmaceutically acceptable salt or prodrug thereof.

The present invention further comprises a pharmaceutical composition for the treatment of a TNF mediated disorder, a p38 kinase mediated disorder, inflammation, and/or arthritis, comprising a therapeutically-effective amount of a compound of Formula XX, or a therapeutically-acceptable salt or prodrug thereof, in association with at least one pharmaceutically-acceptable carrier, adjuvant or diluent.

The compounds of the invention can be prepared according to the following procedures of Schemes I-XXIX wherein R^1 , R^2 , R^3 , R^4 , R^5 and Ar^1 are as previously defined for the compounds of Formula I, IX, X and XI except where expressly noted.

Scheme I shows the synthesis of pyrazole 5 by two routes. Condensation of the pyridylmethyl ketone 1 with aldehyde 2 in the presence of a base, such as piperidine, in a solvent, such as toluene or benzene, either in the absence or the presence of acetic acid at reflux, provides the α,β -unsaturated ketone 3. In route 1, ketone 3 is first converted to epoxide 4, such as by treatment with hydrogen peroxide solution at room temperature, in the presence of base such as sodium hydroxide. Treatment of epoxide 4 with hydrazine in ethanol or other suitable solvent at a temperature ranging up to reflux, yields pyrazole 5. In route 2, ketone 3 is condensed directly with tosyl hydrazide in the presence of an acid such as acetic acid, at reflux,

to provide pyrazole 5. Alternatively, the intermediate tosyl hydrazone 6 may be isolated, conversion of it to pyrazole 5 is effected by treatment with a base, such as potassium hydroxide, in a suitable solvent, such as ethylene glycol, at a temperature ranging from 25 °C up to 150 °C.

SCHEME II

Scheme II shows the synthesis of pyrazole 12 of the present invention. The treatment of pyridine derivative 7 with ester 8 in the presence of a base, such as sodium bis(trimethylsilyl)amide, in a suitable solvent, such as tetrahydrofuran, gives ketone 9. Treatment of ketone 9 or a hydrohalide salt of ketone 9 with a halogenating agent, such as bromine, N-bromosuccinimide or N-chlorosuccinimide, in suitable solvents, such as acetic acid, methylene chloride, methanol, or combinations thereof, forms the α -halogenated ketone 10 (wherein X is halo). Examples of suitable hydrohalide salts include

Thiosemicarbazides which are not commercially available may be conveniently prepared by one skilled in the art by first reacting an appropriate amine with carbon disulfide in the presence of a base, followed by treatment with an alkylating agent such as methyl iodide. Treatment of the resultant alkyl dithiocarbamate with hydrazine results in the desired thiosemicarbazide. This chemistry is further described in E. Lieber and R.C. Orlowski, J. Org. Chem., Vol. 22, p. 88 (1957). An alternative approach is to add hydrazine to appropriately substituted thiocyanates as described by Y. Nomoto et al., Chem. Pharm. Bull., Vol. 39, p.86 (1991). The Lieber and Nomoto publications are incorporated herein by reference.

Where Compound 12 contains a second derivatizable nitrogen atom, a wide range of substituents may be placed on that atom by methods known to those skilled in the art. For example, in cases where R⁶ and R⁷ together with the nitrogen atom to which they are attached comprise a piperazine ring, the distal nitrogen of that ring may be, for example, (i) methylated by reaction with formic acid and formaldehyde; (ii) propargylated by reaction with propargyl bromide in a suitable solvent such as dimethylformamide in the presence of a suitable base such as potassium carbonate; (iii) acylated or sulfonylated by reaction with a suitable acyl or sulfonyl derivative in

pyridine; or (iv) cyclopropanated by reaction with [1(1-ethoxycyclopropyl)oxy]trimethylsilane using sodium cyanoborohydride in the presence of acetic acid.

Additionally, one of the nitrogen atoms of the pyrazole ring optionally may be alkylated by reaction with an alkyl halide, such as propargyl bromide, in the presence of a strong base such as sodium hydride.

SCHEME III

Scheme III shows the synthesis of pyrazole 19 in more general form by three routes. In Route 1, ketone 13 is condensed with hydrazine 14 to give the substituted hydrazide 16, which is then reacted with acyl halide or anhydride 17 at low temperature to provide acyl hydrazone 18. Upon heating at a temperature up to 200°C, acyl hydrazone 18 is converted to pyrazole 19. In Route 2, acyl hydrazone 18 is formed directly by reaction of ketone 13 with acyl hydrazone 15, formed by reaction of hydrazine with a carboxylic acid ester, at room

temperature. Heating acyl hydrazone 18 as above then provides pyrazole 19. In Route 3, ketone 13 is treated with acyl hydrazide 15 at a suitable temperature, ranging from room temperature to about 200 °C, to give pyrazole 19 directly. Alternatively, this condensation may be carried out in an acidic solvent, such as acetic acid, or in a solvent containing acetic acid.

Synthetic Scheme IV describes the preparation of pyrazole 19.

SCHEME V

$X = \text{halyl, alkyl}$
 $R^1 = \text{Me, CH}_2\text{CH}_2\text{OH}$
 $R^4 = \text{cyclopropyl, 4-pyridyl, 4-imidazolyl}$

Scheme V shows the two step synthesis of the 3-substituted 4-pyridyl-5-arylpyrazoles **33** of the present invention by cyclization of hydrazone dianions with carboxylates. In step 1, the reaction of substituted pyridylmethyl ketones **31** (prepared, for example, as later described in Scheme IX) with hydrazines in the presence of solvents such as ethanol gives ketohydrazones **32**. Examples of suitable hydrazines include, but are not limited to, phenylhydrazine and p-methoxyphenylhydrazine. In step 2, the hydrazones **32** are treated with two equivalents of a base such as sodium bis(trimethylsilyl)amide in a suitable solvent such as tetrahydrofuran to generate dianions. This reaction may be carried out at temperatures of about 0 °C or lower. In the same step, the dianions then are condensed with esters such as methyl isonicotinate, methyl cyclopropanecarboxylate, to give the desired pyrazoles

33. It may be necessary to treat the product from this step with a dehydrating agent, such as a mineral acid, to produce the target pyrazole in some instances.

SCHEME VI

Scheme VI shows an alternative method for synthesizing pyrazoles which are unsubstituted at the 5 position of the ring. In accordance with this method, a heteroarylmethyl ketone **34** is synthesized by first treating a heteroarylmethane with a strong base such as lithium hexamethyldisilazide or lithium diisopropylamide. Examples of suitable heteroarylmethanes are 4-methylpyridine, 4-methylpyrimidine, 2,4-dimethylpyridine, 2-chloro-4-methylpyrimidine, 2-chloro-4-methylpyridine and 2-fluoro-4-methylpyridine. The resulting heteroarylmethyl lithium species is then reacted with a substituted benzoate ester to produce ketone **34**. Examples of suitable benzoate esters are methyl and ethyl p-fluorobenzoate and ethyl and methyl p-chlorobenzoate. Ketone **34** is converted to the aminomethylene derivative **35** by reaction with an aminomethylenating agent such as dimethylformamide dimethyl acetal or tert-butoxybis(dimethylamino)methane. Ketone **35** is converted to pyrazole **36** by treatment with hydrazine.

A modification of this synthetic route serves to regioselectively synthesize pyrazole **38** which contains a substituted nitrogen at position 1 of the ring. Ketone **34** is first converted to hydrazone **37** by reaction with the appropriate substituted hydrazine. Examples of suitable hydrazines are N-methylhydrazine and N-(2-hydroxyethyl)hydrazine. Reaction of hydrazone **37** with an aminomethylenating agent produces pyrazole **38**. Examples of suitable aminomethylenating agents include dimethylformamide dimethyl acetal and tert-butoxybis(dimethylamino)methane.

In cases where the R³ substituent of pyrazoles **36** and **38** bears a leaving group such as a displaceable halogen, subsequent treatment with an amine produces an amino-substituted heteroaromatic derivative. Examples of such amines include benzylamine, cyclopropylamine and ammonia.

SCHEME VII

Scheme VII describes the preparation of derivatives from pyrazole 5 (prepared in accordance with Scheme I) when $R^2 = CH_3$. Oxidation of pyrazole 5 gives carboxylic acid 39, which is then reduced to hydroxymethyl compound 40, or coupled with amine $NR^{10}R^{11}$ (wherein R^{10} and R^{11} are independently selected, for example, from hydrogen, alkyl and aryl, or together with the nitrogen atom to which they are attached form a 4-8 membered ring that may contain one or more additional heteroatoms selected from oxygen, nitrogen or sulfur) to form amide 41 followed by reduction to generate amine derivative 42.

SCHEME VIII

Scheme VIII illustrates the synthesis of pyrazoles 44 and 45 from pyrazole 43. The alkylation of the ring nitrogen atoms of pyrazole 43 can be accomplished using conventional techniques. Treatment of pyrazole 43 with an appropriate base (for example, sodium hydride) followed by treatment with an alkyl halide (for example, CH_3I) yields a mixture of isomers 44 and 45.

Scheme IX illustrates the synthesis of 3-aryl-4-pyridyl-pyrazoles of the present invention. Benzoate 46 is reacted with pyridine 47 in the presence of a strong base, such as an alkali metal hexamethyldisilazide (preferably sodium hexamethyldisilazide or lithium hexamethyldisilazide), in a suitable solvent, such as tetrahydrofuran, to give desoxybenzoin 48. Desoxybenzoin 48 is then converted to ketone 49 by treatment with an excess of dimethylformamide dimethyl acetal. Ketone 49 is then reacted with hydrazine hydrate in a suitable solvent such as ethanol to yield pyrazole 50. In Scheme IX, R^{12} represents one or more radicals independently selected from the optional substituents previously defined for R^1 . Preferably, R^{12} is hydrogen, alkyl, halo, trifluoromethyl, methoxy or cyano, or represents methylenedioxy.

The 3-aryl-4-pyrimidinyl-pyrazoles of the present invention can be synthesized in the manner of Scheme IX by replacing pyridine 47 with the corresponding pyrimidine. In a similar manner, Schemes X through XVII can be employed to synthesize 3-aryl-4-pyrimidinyl-pyrimidines corresponding to the 3-aryl-4-pyrimidinyl-pyrazoles shown in those schemes.

SCHEME X

Scheme X illustrates one variation of Scheme IX that can be used to synthesize 3-aryl-4-pyridyl-pyrazoles that are further substituted on the nitrogen atom at position 1 of the pyrazole ring. If desoxybenzoin **48** (prepared in accordance with Scheme IX) instead is first converted to hydrazone **51** by treatment with hydrazine and hydrazone **51** is then treated with dimethylformamide dimethyl acetal, then the resulting product is pyrazole **52**.

Schemes XI through XVIII illustrate further modifications that can be made to Scheme IX to synthesize other 3-aryl-4-pyridyl-pyrazoles having alternative substituents.

SCHEME XISCHEME XII

In Scheme XII, X is chloro, fluoro or bromo; R^{13} is, for example, hydrogen, alkyl, phenyl, aralkyl, heteroarylalkyl, amino or alkylamino; and R^{20} is, for example, hydrogen or alkyl.

SCHEME XIIISCHEME XIV

SCHEME XV

In Scheme XV, n is 1, 2, 3, 4 or 5; and R^{14} and R^{15} are independently selected from, for example, hydrogen, alkyl or aryl, or together with the nitrogen atom to which they are attached form a 4-7 membered ring that may contain one or more additional heteroatoms selected from oxygen, nitrogen or sulfur.

SCHEME XVI

In Scheme XVI, R^{16} is selected, for example, from hydrogen, alkyl and phenyl.

SCHEME XVII

In Scheme XVII, R^{17} is selected, for example, from alkyl, phenylalkyl and heterocyclalkyl.

SCHEME XVIII

Compounds wherein the 2-position of the pyridine ring is substituted by a carboxyl group or a carboxyl derivative may be synthesized according to the procedures outline in Scheme XVIII. The starting pyridyl pyrazole 67 is converted to the 2-cyano derivative 68 by first conversion to its pyridine N-oxide by reaction with an oxidizing agent such as m-chloroperoxybenzoic acid.

Treatment of the pyridine N-oxide with trimethylsilyl cyanide followed by dimethylcarbamoyl chloride produces the 2-cyano compound 68. Compound 68 is converted to its carboxamide 69 by reaction with hydrogen peroxide in the presence of a suitable base. Examples of suitable bases include potassium carbonate and potassium bicarbonate. Carboxamide 69 is converted to its methyl ester 70 by reaction with dimethylformamide dimethyl acetal in methanol. The ester 70 is converted to its carboxylic acid 71 by saponification. Typical saponification conditions include reaction with a base such as sodium hydroxide or potassium hydroxide in a suitable solvent such as ethanol or ethanol and water or methanol and water or the like. Ester 70 is also convertible to substituted amide 72 by treatment with a desired amine, such as methylamine at a suitable temperature. Temperatures may range from room temperature to 180°C. In Scheme XVIII, R¹⁸ and R¹⁹ are independently selected, for example, from hydrogen, alkyl and aryl, or together with the nitrogen atom to which they are attached form a 4-8 membered ring that may contain one or more additional heteroatoms selected from oxygen, nitrogen or sulfur.

SCHEME XIX

The synthesis of compound 77, wherein the amino group is extended two methylene units from the pyrazole

Reaction of compound 74 with a suitable derivative of dimethyl formamide, followed by exposure to water, leads to aldehyde 75. Examples of suitable derivatives of dimethylformamide include tert.-butoxybis(dimethylamino)methane and dimethylformamide dimethyl acetal. One skilled in the art will understand that this leads to the formation of a reactive vinyl amine as an intermediate. The reaction may be carried out in the reagent itself or in the presence of dimethylformamide as solvent. Suitable reaction temperatures range from about 50 °C to about 153 °C. The contacting of the intermediate vinyl amine with water may be carried out in solution in a suitable solvent such as methanol, ethanol, acetone, or dioxane. Alternatively, a solution of the vinyl amine in a suitable solvent may be contacted with hydrated silica gel.

Aldehyde 75 may be reductively aminated to amine 76 by reaction with the desired amine in the presence of a reducing agent. Typical reducing agents include sodium cyanoborohydride, sodium borohydride or hydrogen in the presence of a catalyst, such as a palladium/carbon catalyst or a Raney nickel catalyst, either at atmospheric pressure or in a pressurized system. An acid catalyst such as acetic acid or dilute hydrochloric acid may also be employed. The reaction may be run at ambient temperature or may be heated.

Pyrazole 77 is obtained by removal of the pyrazole nitrogen protecting group. The deprotection reaction employed will depend upon the specific protecting group removed. A 2-(trimethylsilyl)ethoxymethyl group can be removed, for example, by reaction of amine 76 with tetrabutylammonium fluoride while a 2-methoxyethoxymethyl group can be removed, for example, by acid hydrolysis.

SCHEME XX

Treatment of **80** with a substituted benzaldehyde provides unsaturated ketone **81**. Pyrazole **82** may be synthesized by treatment of **81** with *p*-toluenesulfonylhydrazide in the presence of acetic acid. During this reaction, the protecting tert.-butoxycarbonyl group is removed. Derivatization of pyrazole **82** by appropriate methods as described in Scheme II for analogous piperazine derivatives gives various pyrazole derivatives **83**.

Alternatively, the tert.-butoxycarbonyl group of **84** may be reduced with a reagent such as lithium aluminum hydride to provide the methyl derivative **85**.

SCHEME XXI

Scheme XXI shows the synthesis of pyrazoles 92. Treatment of compound 86 with ester 87 in the presence of a base, such as sodium bis(trimethylsilyl)amide, in a suitable solvent such as tetrahydrofuran, gives ketone 88. Substituent R^3 is typically heteroaryl, preferably pyridinyl or pyrimidinyl, and more preferably 4-pyridinyl. Substituent R^4 is typically aryl, substituted aryl, heteroaryl, substituted heteroaryl, alkyl or aralkyl, and is preferably a substituted phenyl. R^{103} can be, for example, lower alkyl.

Treatment of ketone 88 with carbon disulfide, dibromomethane, and a base such as potassium carbonate in a suitable solvent such as acetone gives dithietane 89. Other suitable bases include, but are not limited to, carbonates such as sodium carbonate, tertiary amines such as triethylamine or diazabicycloundecane (DBU), and alkoxides such as potassium tert-butoxide. Other suitable solvents include, but are not limited to, low molecular weight ketones, methyl ethyl ketone, tetrahydrofuran, glyme, acetonitrile, dimethylformamide, dimethylsulfoxide, dichloromethane, benzene, substituted benzenes and toluene.

Dithietane 89 may be reacted with an appropriate amine, with or without heating, in an acceptable solvent such as toluene or acetonitrile to make thioamide 90. Thioamide 90 is treated with hydrazine or a substituted hydrazine in an appropriate solvent such as tetrahydrofuran or an alcohol, with or without heating, to produce pyrazole 92 and/or its tautomer.

Alternatively, thioamide 90 can be reacted with an alkyl halide or a sulphonic acid ester to yield substituted thioamide 91. Substituted thioamide 91 is treated with hydrazine or a substituted hydrazine in an appropriate solvent such as tetrahydrofuran or an alcohol, with or without heating, to produce pyrazole 92 or its tautomer.

R^{104} and R^{105} can be independent radicals or can form a heterocyclyl ring that is optionally substituted and/or contains an additional heteroatom.

Scheme XXII shows the synthesis of substituted 5-

amino pyrazoles 98 and 99. Desoxybenzoin 93 (prepared, for example, as illustrated in Scheme IX, supra, or Example C-1, infra) is reacted with an aminomethylenating agent, such as N,N-dimethylformamide dimethyl acetal, to form aminomethylene ketone 94. Aminomethylene ketone 94 is converted to isoxazole 95 by treatment with a hydroxylamine in a suitable solvent such as ethanol. Isoxazole 95 is treated with a base, such as dilute aqueous sodium hydroxide, to form cyanoketone 96. Cyanoketone 96 is then reacted with a chlorinating agent, such as phosphorous trichloride, to form a vinyl chloride which is then treated with hydrazine hydrate (or a substituted hydrazine hydrate) to form amino pyrazole 97. Amino pyrazole 97 can be reacted further with a variety of alkyl halides, such as methyl bromoacetate, bromoacetonitrile, and chloroethylamine, to form the appropriate mono- or disubstituted, cyclic or acyclic amino pyrazole 98. Typical R^{106} and R^{107} substituents include, for example, hydrogen and alkyl. In addition, amino pyrazole 97 can be reacted further with a variety of acylating agents, such as benzyliminodiacetic acid and N,N-dimethylglycine, to give the corresponding mono- or disubstituted, cyclic or acyclic amide or imide 99. Typical R^{108} and R^{109} substituents include, for example, hydrogen, alkyl and acyl.

SCHEME XXIII

Scheme XXIII shows the synthesis of sulfoxide/sulfone 103. Ketone 100, wherein X is preferably halo such as fluoro or chloro, in a solvent, such as tetrahydrofuran, is treated with a suitable base, such as sodium hydride or potassium t-butoxide, to yield an enolate intermediate. The enolate intermediate is reacted with carbon disulfide and then alkylated with an appropriate alkylating agent, such as methyl iodide, benzyl bromide, or trimethylsilylchloride, to form dithioketene acetal 101. Dithioketene acetal 101 can be cyclized to pyrazole 102 using hydrazine, or its hydrate (or a substituted hydrazine or its hydrate), in a suitable solvent, such as tetrahydrofuran or ethanol. Pyrazole 102 is then treated with an oxidizing agent, such as potassium peroxymonosulfate, ammonium persulfate, or 3-chloroperoxybenzoic acid, to generate sulfoxide 103 (n=1) and/or sulfone 103 (n=2).

SCHEME XXIV

Scheme XXIV shows the synthesis of pyrazole 106. Dithioketene acetal 104 in a suitable solvent, such as toluene, is combined with a secondary amine, wherein Z is preferably S or $-NCH_3$, and heated to about 80-110 °C. After the solution has been heated for several hours, any insoluble bis substituted material may be removed by filtration. Mono substituted product 105 is then reacted with hydrazine, or its hydrate (or a substituted hydrazine or its hydrate), in a solvent, such as tetrahydrofuran or ethanol, at ambient up to reflux temperatures, to form pyrazole 106.

SCHEME XXV

Scheme XXV shows the synthesis of pyrazole **109**. Dithietane **107** is added to a solution of a sodium or potassium alkoxide in tetrahydrofuran. The alkoxide may be generated by treating an alcohol, in tetrahydrofuran, with a suitable base, such as sodium hydride, sodium hexamethyldisilazide, or potassium hexamethyldisilazide. The reaction mixture is stirred from 4 to 72 hours at room temperature. The resulting thionoester **108** is reacted with hydrazine, or its hydrate (or a substituted hydrazine or its hydrate), in ethanol, methanol, or tetrahydrofuran at room temperature for about 2-18 hours to generate pyrazole **109**.

SCHEME XXVI

Scheme XXVI shows the synthesis of pyrazole **112**. To dithietane **107** in a suitable solvent, such as toluene, is added an amine, such as thiomorpholine and heated to about 80-110 °C, to form thioamide **110**. Thioamide **110** may be isolated or used directly in the next reaction step. To thioamide **110** in tetrahydrofuran is added a suitable base, such as potassium t-butoxide, and the resulting thiol anion alkylated with iodomethane to form alkylated thioamide **111**. Alkylated thioamide **111** can be cyclized with hydrazine (or substituted hydrazine), in a solvent, such as tetrahydrofuran or ethanol, to generate pyrazole **112**.

SCHEME XXVII

Scheme XXVII shows the synthesis of pyrazole **114**. Dithietane **107** in a suitable solvent, such as tetrahydrofuran or ethanol, is reacted with hydrazine, or its hydrate (or a substituted hydrazine or its hydrate), at room temperature up to the reflux temperature of the solvent to generate thiopyrazole **113**. The thiol group of thiopyrazole **113** may be alkylated with a variety of alkylating agents, such as alkyl halides or Michael acceptors, including, but not limited to, methyl chloroacetate, ethyl acrylate, and benzyl bromide, in the presence of a suitable base such as potassium carbonate, sodium ethoxide or triethylamine, in a solvent such as dimethylformamide or ethanol to generate pyrazole **114**.

SCHEME XXVIII

Scheme XXVIII shows the synthesis of pyrazole 117. Pyrazoles containing acid labile amine protecting groups, such as pyrazole 115, may be treated with a suitable acid catalyst, such as trifluoroacetic acid in dichloromethane or HCl in ethanol or dioxane to yield amine 116. Amine 116 can then be acylated or alkylated by methods known to one of ordinary skill in the art, such as reacting amine 116 with a reagent such as acetyl chloride or methyl iodide in the presence of a suitable base, such as potassium carbonate or triethylamine. In addition, N-methylation can be performed directly, using formaldehyde and formic acid in ethanol/water at reflux to give pyrazole 117 wherein R¹¹⁴ is methyl.

Scheme XXIX shows the synthesis of pyrazole 120. Pyrazoles containing base labile esters, such as pyrazole 118, may be treated with a suitable base, such as, sodium hydroxide to generate free acid 119. Acid 119 can then be aminated by methods known to one of ordinary skill in the art, such as treating acid 119 with a suitable coupling reagent, such as 1-(3-dimethylaminopropyl)3-ethylcarbodiimide hydrochloride or O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium tetrafluoroborate, with or without catalysts, such as 1-hydroxybenzotriazole or N-hydroxysuccinimide, and an appropriate amine. In addition, amidation can be performed directly, by treating the methyl ester with an appropriate amine, for example N-methylpiperazine, in a suitable solvent such as dimethylformamide or methanol, at a temperature from room temperature up to reflux to generate pyrazole 120.

The reaction mixture was stirred at 0-10 °C for another 30 minutes, then was added to a solution of ethyl 4-fluorobenzoate (16.8 g, 0.10 mol) in dry THF (200 mL) at such a rate that the internal temperature didn't exceed 15 °C. After the addition, the resulting yellow suspension was stirred at room temperature for 3 hours. Water (600 mL) was added and the aqueous phase was extracted with ethyl acetate (3 X 200 mL). The combined organic layers were washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated in vacuo to give 1-fluoro-4-(4'-pyridylacetyl)benzene (19.9 g, 92 %) as an oil which solidified upon standing: m.p.: 90-91 °C; Anal. The compounds of Examples A-191 through A-198 were synthesized in accordance with the chemistry described above (particularly in Scheme V) by selection of the corresponding starting reagents:

Example A-191

4-[5-(cyclopropyl)-3-(4-(fluorophenyl))-1-methyl-1H-pyrazol-4-yl]pyridine

Step 1: Preparation of 1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone methylhydrazone

1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone methylhydrazone

To a solution of 4-fluorobenzoyl-4'-pyridinyl methane (8.60 g, 0.04 mol) and methyl hydrazine (2.14 g, 0.044 mol) in 50 mL of ethanol was added two drops of concentrated sulfuric acid. The reaction mixture was stirred at room temperature overnight. After the removal of solvent, the residue was partitioned between ethyl acetate and water. The organic layer was washed with saturated sodium carbonate solution, washed with brine, and dried over magnesium sulfate. The filtrate was concentrated and the crude product was recrystallized from diethyl ether and hexane to afford 7.5 g of a yellow solid product (77% yield), 1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone methylhydrazone.

Step 2: Preparation of 4-[5-(cyclopropyl-3-(4-(fluorophenyl))-1-methyl-1H-pyrazol-4-yl)]pyridine

To a solution of sodium hexamethyldisilazide (5.5 mL, 1.0 M in THF) at 0 °C was added a solution of the compound prepared in step 1 (0.67 g, 0.0028 mol) in 10 mL of dry THF dropwise. The dark brown solution was stirred at this temperature for 30 minutes. Then a solution of methyl cyclopropanecarboxylate (0.34 g, 0.0034 mol) in 5 mL of dry THF was added. The reaction mixture was allowed to warm up to room temperature and stirred for 3 hours. Water was added and the aqueous phase was extracted with ethyl acetate. The organic layer was washed with brine, dried over magnesium sulfate and

filtered. The filtrate was concentrated and purified by chromatography on silica gel (ethyl acetate/hexane/acetone, 10:9:1) to give 0.45 g of product, 4-[5-(cyclopropyl-3-(4-(fluorophenyl)-1-methyl-1H-pyrazol-4-yl)]pyridine, as a light yellow solid (55% yield), mp: 129-130 °C; ^1H NMR (CDCl_3): δ 8.53 (m, 2H), 7.32 (m, 2H), 7.14 (m, 2H), 6.97 (m, 2H), 4.00 (s, 3H), 1.83 (m, 1H), 0.95 (m, 2H), 0.36 (m, 2H); Anal. Calc'd For $\text{C}_{18}\text{H}_{16}\text{FN}_3$: C, 73.70; H, 5.50; N, 14.32. Found: C, 73.63; H, 5.57; N, 14.08.

Example A-192

5-cyclopropyl-3-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-1-ethanol

Step 1: Preparation of 1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone (2-hydroxyethyl)hydrazone

1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone (2-hydroxyethyl)hydrazone

To a flask containing hydroxyethyl hydrazine (3.4 g, 0.04 mol) at 80 °C was added 4-fluorobenzoyl-4'-pyridinyl methane (8.6 g, 0.04 mol) portionwise. The yellow oil was stirred at this temperature overnight. The cooled

reaction mixture was dissolved with hot ethyl acetate and then triturated with hexane to give 8.9 g of product, 1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone (2-hydroxyethyl)hydrazone, as a yellow crystal (81%), mp: 122-123 °C.

Step 2: Preparation of 1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone [2-[[1,1-dimethylethyl)dimethylsilyl]oxy]ethyl]hydrazone

1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone
[2-[[1,1-dimethylethyl)dimethylsilyl]oxy]ethyl]hydrazone

To a solution of the 1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone (2-hydroxyethyl)hydrazone prepared in step 1 (2.73 g, 0.01 mol) and (1,1-dimethylethyl)dimethylsilyl chloride (1.5 g, 0.01 mol) in 25 mL of DMF was added imidazole portionwise. The reaction mixture was stirred at room temperature overnight. Water was added and extracted with ethyl acetate, the organic layer was washed with water, washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated to give 3.8 g of crude product, 1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone [2-[[1,1-dimethylethyl)dimethylsilyl]oxy]ethyl]hydrazone, as a yellow oil that was used in the next step without further purification.

Example A-208

4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]pyridine

Step 1: Preparation of 4-fluorobenzoyl-4'-pyridyl methane

To a mixture of 4-picoline (32.6 g, 0.35 moles) and ethyl-4-fluorobenzoate (50.45g, 0.3 moles), maintained at 20 °C, was added lithium bis(trimethylsilylamide) (600 mL (1M)) in a steady but rapid stream so as to maintain ambient temperature. The initial yellow solution turned into a suspension which was then stirred for an additional 2 hours. Toluene (250 mL) was added and the mixture cooled to 0 °C. The reaction mixture was quenched with concentrated HCl at 0 °C to lower the pH to about 7. The organic layer was separated and the aqueous layer re-extracted with of toluene (100 mL). The organic layer was dried (sodium sulfate) and concentrated, to furnish a yellow solid which on trituration with hexanes (200 mL) provided the pure desoxybenzoin, 4-fluorobenzoyl-4'-pyridyl methane, in 90% yield (58g). ¹H NMR was consistent with the proposed structure.

Step 2:

To a suspension of the desoxybenzoin prepared in step 1 (30g, 0.14 moles) in tetrahydrofuran (50 mL) was added dimethylformamide dimethyl acetal (50 mL) and the mixture stirred at ambient temperature for two days. The solution was then concentrated to dryness and the solid paste obtained was triturated with hexanes (150 mL) to furnish a yellow solid which was of sufficient purity (as determined by NMR) and was used for the next step without additional purification. Yield: 33.9 g (90%). ¹H NMR was consistent with the proposed structure.

Step 3:

The vinyl amine prepared in step 2 (33.9g, 0.1255 moles) was dissolved in 125 mL of ethanol and cooled to 0 °C. Hydrazine hydrate (8.0g of anhydrous or 16.0g. of hydrate, 0.25 moles) was then added in one portion. The mixture was stirred well and allowed to warm up to

ambient temperature for a total reaction time of 3 hours. The mixture was concentrated and taken up in 200 mL of chloroform. After washing with water (100 mL), the organic layer was extracted with 150 mL of 10% HCl. The water layer was then treated with 0.5 g of activated charcoal at 70 °C for 10 minutes, filtered through celite and neutralized cautiously to pH 7 - 8 with vigorous stirring and cooling (20% sodium hydroxide was used). The fine off-white precipitate was filtered and dried to give 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]pyridine. Yield: 27.3g. (91%). Mass spectrum: m/z = 240. ^1H NMR was consistent with the proposed structure. Anal. calc'd for $\text{C}_{14}\text{H}_{10}\text{FN}_3$: C, 70.28; H, 4.21; N, 17.56. The compounds of Examples A-210 and A-211 illustrate were prepared in accordance with the chemistry described above (particularly in Scheme X):

Example A-210

3-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-1-ethanol

The desoxybenzoin prepared in step 1 of Example A-208, 4-fluorobenzoyl-4'-pyridyl methane, (12.7g, 0.059 moles) was mixed with 90% hydroxyethyl hydrazine (5.3g, 0.062 moles) in 30 mL of ethanol containing 0.5 mL of acetic acid in a 500 mL Erlenmeyer flask. After gentle boiling (1 hour), a small sample was evacuated at high vacuum and examined by ¹H NMR to confirm completion of hydrazone formation. On cooling to ambient temperature, the reaction mass solidified to a yellow cake. DMF dimethylacetal (36 mL, 0.27 moles) was then added and the mixture heated to 80°C for 10min, at which point all the solids dissolved and a clear yellow viscous solution was obtained. The reaction mixture was immediately allowed to cool slowly to 25 °C, and water (20 mL) was added dropwise with stirring, at which point a cloudy yellow oily suspension was obtained. The solution was now warmed to approximately 50-60 °C, whereupon the solution turned clear yellow. Slow cooling to ambient temperature with stirring (a crystal seed if available speeds up the process) results in a copious formation of crystals. Suction filtration followed by washing with 10% ethanol-water (50 mL), followed by drying, furnishes 3-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-1-ethanol as a light yellow crystalline solid. Re-heating the filtrate to clarity as before, followed by cooling, yields additional product. The third and fourth recovery from

the mother liquor on standing overnight furnishes the remaining 3-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-1-ethanol. Total yield: {12.3 + 3.3 + 0.4 + 0.4} = 16.4g. (97.6%). Mass spectrum, m/z = 284. ^1H NMR was consistent with the proposed structure. Anal. calc'd for $\text{C}_{16}\text{H}_{14}\text{FN}_3\text{O}$ + H_2O : C, 63.78; H, 5.35; N, 13.95. Example A-212

4-[3-(4-fluorophenyl)-1-methyl-1H-pyrazol-4-yl]pyridine

The vinyl amine prepared in Step 2 of Example A-208 (5.0g, 0.0185 moles) was taken up in ethanol (75mL) and

cooled to 0 °C. Methyl hydrazine (1.7g, 0.037 moles) in ethanol (75mL) was added in one portion while maintaining the temperature at 0 to 10 °C. After 3 hours at ambient temperature the solvent was removed and the residue taken up in methylene chloride (150 mL) and water (100 mL). The organic layer was separated, dried and concentrated to provide the crude regio-isomeric mixture as a light tan colored solid (80:20 by NMR in favor of the title compound). The crude isomeric mixture was taken up in 10% HCl (100 mL) and washed with methylene chloride (100 mL) and the water layer treated with activated charcoal (0.5g). After filtration through Celite, the solution was neutralized with sodium hydroxide (20%) to pH 8 with good stirring and cooling. The cream colored precipitate was filtered, washed with water and dried. The solid (5 g) was dissolved in hot 10% heptane/toluene (70 mL) and allowed to cool slowly, first to ambient temperature and then to 15 °C. Scratching the sides of the flask starts the crystallization process. After 2 hours of standing, the solids formed were filtered, washed with cold 50% toluene/heptane (25 mL) followed by hexane (25 mL) and dried to yield the pure title compound. ¹H NMR confirmed the structure (including regiochemistry using NOE experiments). Yield: 2.1g. (45%). Mass spectrum, m/z = 254 (base peak). Anal. calc'd for C₁₅H₁₂FN₃ + 0.2 H₂O: C, 70.15; H, 4.86; N, 16.4. Found: C, 70.18; H, 4.6; N, 16.47.

To a solution of the product of step 1 (5.1 g, 0.02 mol) in 20 mL of DMF was added trimethylsilyl cyanide (2.5 g, 0.025 mol), followed by a solution of N, N-dimethylcarbonyl chloride (2.7 g, 0.025 mol) in 5 mL of DMF at room temperature. After stirring overnight, the reaction mixture was basified by 200 mL of 10% potassium carbonate water solution. The aqueous phase was extracted with ethyl acetate. The organic layer was washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated and the crude

was triturated with hexane and filtered to give 4.3 g of 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarbonitrile (90%) as a pale yellow solid, mp: 238-239°C.

Step 3: Preparation of 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarboxamide:

To a solution of 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarbonitrile from step 2 (0.45 g, 0.0017 mol) in 10 mL of DMSO was added hydrogen peroxide (0.24 mL of 30% aqueous solution, 1.7 mmol) and potassium carbonate (0.04 g, 0.4 mmol) at 0°C. The mixture was stirred for 1 hour while allowing it to warm to room temperature. Water was added and the precipitate was collected by filtration and air-dried to give 0.32 g of 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarboxamide as a white solid (67% yield), mp: 230-231 °C. Anal. Calc'd for $C_{15}H_{11}FN_4O$: C, 63.83; H, 3.93; N, 19.85. Found C, 63.42; H, 3.66; N, 19.58.

mol) dropwise. The reaction mixture was stirred at room temperature overnight and heated at reflux for 4 hours. After cooling, the precipitate was collected by filtration and air-dried to give 2.0 g of methyl 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarboxylate as a white solid (69% yield), mp: 239-241°C. Anal. Calc'd for $C_{16}H_{12}FN_3O_2$: C, 64.64; H, 4.07; N, 14.13. Found: C, 64.36; H, 4.10; N, 14.27.

Example A-225

4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-N-methyl-2-pyridinecarboxamide

A mixture of methyl 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarboxylate prepared as set forth in Example A-224 (0.45 g, 1.5 mmol) and 20 mL of methylamine (40% aqueous solution) was heated at 120°C in a sealed tube for 16 hours. After cooling, water was added and the aqueous phase was extracted with ethyl acetate. The organic layer was washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated to afford 0.4 g of 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-N-methyl-2-pyridinecarboxamide as a white solid, mp: 88-89°C. Anal. Calc'd for $C_{16}H_{13}FN_4O + 0.4 H_2O$: C, 63.32; H, 4.58; N, 18.46. Found C, 63.10; H, 4.62; N, 18.35.

Example A-226

4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarboxylic acid

To a solution of 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarboxylate prepared as set forth in Example A-224 (0.90 g, 0.003 mol) in 10 mL of ethanol was added a solution of sodium hydroxide (0.24 g, 0.006 mol) in 5 mL of water. The reaction mixture was heated at reflux for 10 hours. After the removal of solvent, the residue was dissolved in water and acidified with citric acid solution to pH 5. Then the aqueous phase was extracted with ethyl acetate and the organic phase was dried over magnesium sulfate and concentrated. The crude was purified by treating with ether to give 0.62 g of 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2-pyridinecarboxylic acid as a white solid (73% yield), mp: 245°C(dec). Anal Calc'd for $C_{15}H_{10}FN_3O + 0.2 H_2O$: C, 62.80; H, 3.65; N, 14.65. Found: C, 62.77; H, 3.42; N, 14.58.

Additional compounds of the present invention which were prepared according to one or more of above reaction schemes (particularly Schemes IX through XVIII) are disclosed in Table 3. After 0.5 hour, the catalyst was filtered and the filtrate was concentrated. The crude was purified by chromatography on silica gel (ethyl acetate/hexane, 3:7) to give 2.36 g of product as a pale yellow crystal (50% yield); mp: 47-49 °C.

Step 2: Preparation of 2-(2-chloro-4-pyrimidinyl)-1-(4-fluorophenyl)ethanone

After 1 hour, a solution of ethyl 4-fluorobenzoate (7.62 g, 0.045 mol) in THF was added and the reaction mixture was stirred overnight and allowed to warm up to room temperature. Water was added and the aqueous phase was extracted with ethyl acetate. Organic layer was washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated and the crude product purified by chromatography on silica gel (ethyl acetate/hexane, 3:7) to give 4.78 g of a yellow solid (51% yield), mp: 112-113 °C.

Step 1: Preparation of 5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-3-carboxylic acid, monohydrate

10 A mixture of 4-[3-(4-fluorophenyl)-5-methyl-1H-pyrazol-4-yl]pyridine (5.8 g, 24.0909 mmol; prepared as set forth in Example A-4) and potassium permanganate (7.6916 g, 48.1818 mmol) in water (7.5 mL) and *tert*-butanol (10 mL)

15 was heated to reflux at 95 to 100 °C for 6 hours (or until all the potassium permanganate was consumed) and stirred at room temperature overnight. The mixture was diluted with water (150 mL) and filtered to remove manganese dioxide. The aqueous filtrate (pH >10) was

20 extracted with ethyl acetate to remove unreacted starting material. The aqueous layer was acidified with 1N HCl to a pH of about 6.5. A white precipitate was formed. This precipitate was collected by filtration, dried in air, and then dried in a vacuum oven overnight at 50 °C to

25 give 5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-3-carboxylic acid, monohydrate (2.7677 g, 40.6 %). The remaining product (0.21 g, 3.1%) was isolated from the

mother liquid by reverse phase chromatography. The total isolated yield of 5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-3-carboxylic acid, monohydrate was 43.7 %. Anal. Calc'd for $C_{15}H_{10}N_3FO_2 \cdot H_2O$: C, 59.80; H, 4.01; N, 13.95; Found: C, 59.48; H, 3.26; N, 13.65. MS (MH^+): 284 (base peak).

10 Step 2: Preparation of 1,1-dimethylethyl 4-[[5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazol-3-yl]carbonyl]-1-piperazinecarboxylate

In a solution of 5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-3-carboxylic acid, monohydrate (0.9905 g, 3.5 mmol) from step 1 and 1-hydroxybenzotriazole hydrate (0.4824 g, 3.57 mmol) in dimethylformamide (20 mL) at 0 °C under N_2 , 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (0.6983 g, 3.57 mmol) was added. The solution was stirred at 0 °C under N_2 for 1 hour, then was added 1-tert.-butoxycarbonylpiperazine (0.6585 g, 3.5 mmol) followed by N-methyl morpholine (0.40 mL, 3.6 mmol). The reaction was stirred from 0 °C to room temperature overnight. The reaction mixture was diluted with ethyl acetate and saturated $NaHCO_3$ solution, extracted. The organic layer was washed with water and brine, and dried over $MgSO_4$. After filtration, the solvent was removed under reduced pressure, and crude product was obtained (1.7595 g). The desired product 1,1-dimethylethyl 4-[[5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazol-3-yl]carbonyl]-1-piperazinecarboxylate (1.2375 g, 78.4 %) was isolated by chromatography (silica gel, 10:90

isopropyl alcohol/toluene). Anal. Calc'd for $C_{24}H_{26}N_5FO_3$: C, 63.85; H, 5.80; N, 15.51; Found: C, 63.75; H, 5.71; N, 15.16. MS (MH^+): 452 (base peak).

5 Step 3: Preparation of 1-[[5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazol-3-yl]methyl]-4-methylpiperazine

To a suspension of 1,1-dimethylethyl 4-[[5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazol-3-yl]carbonyl]-1-piperazinecarboxylate (0.451 g, 1.0 mL) in dry
 10 tetrahydrofuran (8 mL), 1.0N $LiAlH_4$ in tetrahydrofuran (2.5 mL, 2.5 mmol) was added dropwise at such a rate as to maintain reflux over 15 minutes. Upon the addition, the suspension became a clear light yellow solution,
 15 which was kept boiling for an additional 1.5 hours. Excess $LiAlH_4$ was decomposed by cautious addition of a solution of KOH (0.5611 g, 10.0mmol) in water (3.5 mL). Upon hydrolysis, a white salt precipitated. After the addition was completed, the mixture was heated to reflux
 20 for 1 hour. The hot solution was filtered by suction through a buchner funnel. Any remaining product was extracted from the precipitate by refluxing with tetrahydrofuran (10mL) for 1 hour, followed again by suction filtration. The combined filtrates were
 25 concentrated under reduced pressure to give a crude residue, which was then diluted with ethyl acetate and washed with water and brine. The organic layer was dried over $MgSO_4$. After filtration, the solvent was removed under reduced pressure, and a crude product was obtained.

25 Step 1: Preparation of ethyl 1-[(1,1-dimethylethoxy)carbonyl]-4-piperidineacetate

Ethyl 4-pyridyl acetate was converted to 2-(4-piperidinyl) ethyl acetate hydrochloride by hydrogenation (60 psi H₂) catalyzed by 5% Pt/C at 40 °C in ethanol and HCl solution. To a solution of 2-(4-piperidinyl)ethyl acetate hydrochloride (21.79g, 0.105mol) in tetrahydrofuran (500 mL) at 0 °C, triethylamine (32.06 mL, 0.230 mL) was added followed by di-tert-butylidicarbonate (23.21g, 0.105mol). The reaction mixture was stirred under N₂ from 0 °C to room temperature overnight. After removing tetrahydrofuran, the reaction mixture was diluted with ethanol, washed with saturated NaHCO₃, 10 % citric acid, water and brine, and dried over MgSO₄. After filtration, the solvent was removed under reduced pressure. The resulting oily product was dried under vacuum to give ethyl 1-[(1,1-dimethylethoxy)carbonyl]-4-piperidineacetate (27.37 g, 95.9 %). The structure of this product was confirmed by NMR.

After the addition, the lithium diisopropylamide solution was stirred at 0 °C for 20 minutes, then cooled to -78 °C. 4-Picoline (3.98 mL, 40.53 mmol) was added to the above lithium diisopropylamide solution under N₂ dropwise over 10 minutes. The resulting solution was stirred at -78 °C under N₂ for 1.5 hours, then transferred into a suspension

of anhydrous cerium chloride (10.0 g, 40.53 mmol) in tetrahydrofuran (40 mL) at -78 °C under N₂. The mixture was stirred at -78 °C under N₂ for 2 hours, then a solution of ethyl 1-[(1,1-dimethylethoxy)carbonyl]-4-piperidineacetate (from step 1 of this Example) (10.98 g, 40.53 mmol) in tetrahydrofuran (40 mL) was added slowly for 1 hour. 1-[5-(3-tolyl)-4-(4-pyridinyl)-1H-pyrazol-3-yl]-4-methylpiperazine:

15 Step 1. Preparation of 1-tolyl-2-(4-pyridyl)ethanone

20 Methyl 3-methylbenzoate (6.0 g, 40 mmol),
tetrahydrofuran (50 mL), and 4-picoline (4.1 g, 44 mmol)
were stirred at -78 °C under an atmosphere of nitrogen.

Sodium (bis)trimethylsilylamide 1.0 M in tetrahydrofuran (88 mL, 88 mmol) was added dropwise. The mixture was allowed to warm to room temperature, stirred for 16 hours and then was poured into saturated aqueous sodium bicarbonate solution. The mixture was then extracted with ethyl acetate (3 X 50 mL). The combined organics were washed with brine (2 X 50 mL), dried over magnesium sulfate, and concentrated. The product was recrystallized from ethyl acetate/hexane to yield a light yellow solid (5.7 g, 67%), mp 118.0-119.0 °C; ¹H NMR (acetone-d₆/300 MHz) 8.50 (m, 2H), 7.90 (m, 2H), 7.44 (m, 2H), 7.29 (m, 2H), 4.45 (s, 2H), 2.41 (s, 3H); ESHRMS m/z 212.1067 (M+H, C₁₄H₁₃NO requires 212.1075); Anal. Calc'd for C₁₄H₁₃NO: C, 79.59; H, 6.20; N, 6.63. Found: C, 79.54; H, 6.30; N, 6.56.

Step 2. Preparation of 1-(3-tolyl)-2-(1,3-dithietan-2-ylidene)-2-(4-pyridyl)ethanone

20

1-tolyl-2-(4-pyridyl)ethanone (4.22 g, 20 mmol), acetone (100 mL), potassium carbonate (8.3 g, 60 mmol), carbon disulfide 4.56 g, 60 mmol), and dibromomethane (10.43 g, 60 mmol) were stirred at room temperature for 16 hours. Water (100 mL) was added and the mixture was extracted with ethyl acetate (3 X 50 mL). The combined organic extracts were washed with brine (2 X 50 mL), dried over magnesium sulfate and concentrated. This crude material was purified by either flash column chromatography eluting with ethyl acetate:hexane or crystallization from ethyl acetate/hexane to yield a

30

yellow solid (4.8 g, 80%), mp 178.6-179.2 °C; ¹H NMR (acetone-d₆/300 MHz) 8.47 (m, 2H), 7.08 (m, 6H), 4.37 (s, 2H), 2.21 (s, 3H); ESHRMS *m/z* 300.0521 (M+H, C₁₆H₁₃NOS₂ requires 300.0517); Anal. Calc'd for C₁₆H₁₃NOS₂: C, 64.18; H, 4.38; N, 4.68. Found: C, 64.08; H, 4.25; N, 4.62.

Step 3. Preparation of 1-[3-(3-tolyl)-3-oxo-2-(4-pyridinyl)-1-thiopropyl]-4-methylpiperazine

10

The dithietane compound from step 2 above (3.0 g, 10 mmol), N-methylpiperazine (5.0 g, 50 mmol), and toluene (50 mL) were refluxed using a Dean-Stark apparatus for one to three hours. The reaction was allowed to cool to room temperature and was concentrated to dryness under high vacuum. This thick, oily material was crystallized from ethyl acetate / hexane (2.9 g, 82%), mp 124.8-125.8 °C; ¹H NMR (acetone-d₆/300 MHz) 8.57 (m, 2H), 7.75 (m, 2H), 7.54 (m, 2H), 7.37 (m, 2H) 6.54 (s, 1H), 4.27 (m, 2H), 4.19 (m, 1H), 3.83 (m, 1H), 2.47-2.28 (m, 6H), 2.22 (s, 3H), 2.17 (m, 1H); ESHRMS *m/z* 354.1669 (M+H, C₂₀H₂₃N₃OS requires 354.1640); Anal. 25 To the compound of Example A-434 (285 mg, 1 mmol) in ethanol (10 mL) was added potassium peroxymonosulfate (2.45 gm, 4 mmol) and water (5 mL). The reaction mixture was stirred at ambient temperature. After 6 hours the reaction mixture was diluted with water (20 mL) and

To the compound of Example A-432 (638 mg, 2 mmol) in toluene (6 mL) was added thiomorpholine (502 μL , 5 mmol). The reaction mixture was heated to between 80 and 110 °C.
 20 After about three hours the bis-thiomorpholine substituted product began to precipitate from the reaction mixture. When the dithioketene acetal had been completely consumed, the reaction mixture was cooled to room temperature and the insoluble bis-thiomorpholine
 25 compound removed by filtration. To the toluene solution was added hydrazine hydrate (1 mL) and sufficient ethanol to create a homogeneous solution. The reaction mixture was then stirred at room temperature for 72 hours. The reaction mixture was diluted with ethyl acetate (50 mL)
 30 and extracted twice with water (25 mL) and once with brine (25 mL). The organic solution was dried (MgSO_4), filtered and concentrated to a reddish solid. The solid was triturated with acetonitrile, collected by suction

filtration, and dried in-vacuo. The solid was then
suspended in acetonitrile and heated to reflux. Ethyl
acetate was then added until the solid almost completely
dissolved. A small amount of ethanol was then added and
the homogeneous yellow solution concentrated until a

To the dithietane of Step 1 of Example A-341 (638 mg, 2 mmol) in toluene (15 mL) was added thiomorpholine (800 uL, 8 uL). The reaction mixture was heated to reflux for 6 hours, then cooled to room temperature and diluted with toluene (20 mL). The reaction mixture was then extracted twice with water (20 mL) and brine (20 mL). The organic solution was dried (MgSO₄), filtered, and concentrated to an oil. Hexane was added to the residue and heated to reflux, then decanted. The oil became semi-solid. The semi-solid was dissolved in tetrahydrofuran (10 mL) and potassium t-butoxide 1M in tetrahydrofuran (2 mL, 2 mmol) was added. This was followed by iodomethane (125 uL, 2 mmol). The reaction was stirred at room temperature for 1 hour, then quenched with water (20 mL). The reaction mixture was extracted with ethyl acetate (2 x 30 mL). The organic layers were pooled, washed with brine (20 mL) and dried (MgSO₄). Filtration and concentration produced an oil which was chased once with toluene to remove any ethyl acetate. The residue was dissolved in ethanol (10 mL) and hydrazine hydrate (97 uL, 2 mmol) was added. The reaction mixture was stirred at room temperature for 4 hours then partitioned between ethyl acetate and saturated sodium bicarbonate solution (30 mL each). The layers were separated and the aqueous layer extracted again with ethyl acetate (30 mL). The combined organic

BIOLOGICAL EVALUATION**p38 Kinase Assay****Cloning of human p38a:**

The coding region of the human p38a cDNA was obtained by PCR-amplification from RNA isolated from the human monocyte cell line THP.1. First strand cDNA was synthesized from total RNA as follows: 2 μ g of RNA was annealed to 100 ng of random hexamer primers in a 10 μ l reaction by heating to 70 °C for 10 minutes followed by 2 minutes on ice. cDNA was then synthesized by adding 1 μ l of RNasin (Promega, Madison WI), 2 μ l of 50 mM dNTP's, 4 μ l of 5X buffer, 2 μ l of 100 mM DTT and 1 μ l (200 U) of Superscript II TM AMV reverse transcriptase. Random primer, dNTP's and Superscript TM reagents were all purchased from Life-Technologies, Gaithersburg, MA. The reaction was incubated at 42 °C for 1 hour. Amplification of p38 cDNA was performed by aliquoting 5 μ l of the reverse transcriptase reaction into a 100 μ l

PCR reaction containing the following: 80 μ l dH₂O, 2 μ l 50 mM dNTP's, 1 μ l each of forward and reverse primers (50 pmol/ μ l), 10 μ l of 10X buffer and 1 μ l ExpandTM polymerase (Boehringer Mannheim). The PCR primers

5 incorporated Bam HI sites onto the 5' and 3' end of the amplified fragment, and were purchased from Genosys. The sequences of the forward and reverse primers were 5'-GATCGAGGATTCATGTCTCAGGAGAGGCCCA-3' and 5'-GATCGAGGATTCTCAGGACTCCATCTCTTC-3' respectively. The

10 PCR amplification was carried out in a DNA Thermal Cycler (Perkin Elmer) by repeating 30 cycles of 94 °C for 1 minute, 60 °C for 1 minute and 68 °C for 2 minutes. After amplification, excess primers and unincorporated dNTP's were removed from the amplified fragment with a

15 WizardTM PCR prep (Promega) and digested with Bam HI (New England Biolabs). The Bam HI digested fragment was ligated into BamHI digested pGEX 2T plasmid DNA (PharmaciaBiotech) using T-4 DNA ligase (New England Biolabs) as described by T. Maniatis, *Molecular Cloning: A Laboratory Manual*, 2nd ed. (1989). The ligation

20 reaction was transformed into chemically competent *E. coli* DH10B cells purchased from Life-Technologies following the manufacturer's instructions. Plasmid DNA was isolated from the resulting bacterial colonies using a Promega WizardTM miniprep kit. Plasmids containing the appropriate Bam HI fragment were sequenced in a DNA Thermal Cycler (Perkin Elmer) with PrismTM (Applied Biosystems Inc.). cDNA clones were identified that coded for both human p38a isoforms (Lee et al. Nature 372,

30 739). One of the clones which contained the cDNA for p38a-2 (CSBP-2) inserted in the cloning site of pGEX 2T, 3' of the GST coding region was designated pMON 35802. The sequence obtained for this clone is an exact match of the cDNA clone reported by Lee et al. This expression

35 plasmid allows for the production of a GST-p38a fusion protein.

100430-100430

Expression of human p38a:

GST/p38a fusion protein was expressed from the plasmid pMON 35802 in *E. coli*, strain DH10B (Life Technologies, Gibco-BRL). Overnight cultures were grown in Luria Broth (LB) containing 100 mg/ml ampicillin. The next day, 500 ml of fresh LB was inoculated with 10 ml of overnight culture, and grown in a 2 liter flask at 37 °C with constant shaking until the culture reached an absorbance of 0.8 at 600 nm. Expression of the fusion protein was induced by addition of isopropyl b-D-thiogalactoside (IPTG) to a final concentration of 0.05 mM. The cultures were shaken for three hours at room temperature, and the cells were harvested by centrifugation. The cell pellets were stored frozen until protein purification.

Purification of p38 Kinase- α :

All chemicals were from Sigma Chemical Co. unless noted. Twenty grams of *E. coli* cell pellet collected from five 1 L shake flask fermentations was resuspended in a volume of PBS (140 mM NaCl, 2.7 mM KCl, 10 mM Na₂HPO₄, 1.8 mM KH₂PO₄, pH 7.3) up to 200 ml. The cell suspension was adjusted to 5 mM DTT with 2 M DTT and then split equally into five 50 ml Falcon conical tubes. The cells were sonicated (Ultrasonics model W375) with a 1 cm probe for 3 X 1 minutes (pulsed) on ice. Lysed cell material was removed by centrifugation (12,000 x g, 15 minutes) and the clarified supernatant applied to glutathione-sepharose resin (Pharmacia).

Glutathione-Sephadex Affinity Chromatography:

Twelve ml of a 50% glutathione sepharose-PBS suspension was added to 200 ml clarified supernatant and incubated batchwise for 30 minutes at room temperature. The resin was collected by centrifugation (600 x g, 5 min) and washed with 2 x 150 ml PBS/1% Triton X-100,

followed by 4 x 40 ml PBS. To cleave the p38 kinase from the GST-p38 fusion protein, the glutathione-sepharose resin was resuspended in 6 ml PBS containing 250 units thrombin protease (Pharmacia, specific activity > 7500 units/mg) and mixed gently for 4 hours at room temperature. The glutathione-sepharose resin was removed by centrifugation (600 x g, 5 min) and washed 2 x 6 ml with PBS. The PBS wash fractions and digest supernatant containing p38 kinase protein were pooled and adjusted to 0.3 mM PMSF.

Mono Q Anion Exchange Chromatography:

The thrombin-cleaved p38 kinase was further purified by FPLC-anion exchange chromatography. Thrombin-cleaved sample was diluted 2-fold with Buffer A (25 mM HEPES, pH 7.5, 25 mM beta-glycerophosphate, 2 mM DTT, 5% glycerol) and injected onto a Mono Q HR 10/10 (Pharmacia) anion exchange column equilibrated with Buffer A. The column was eluted with a 160 ml 0.1 M-0.6 M NaCl/Buffer A gradient (2 ml/minute flowrate). The p38 kinase peak eluting at 200 mM NaCl was collected and concentrated to 3-4 ml with a Filtron 10 concentrator (Filtron Corp.).

Sephacryl S100 Gel Filtration Chromatography:

The concentrated Mono Q- p38 kinase purified sample was purified by gel filtration chromatography (Pharmacia HiPrep 26/60 Sephacryl S100 column equilibrated with Buffer B (50 mM HEPES, pH 7.5, 50 mM NaCl, 2 mM DTT, 5% glycerol)). Protein was eluted from the column with Buffer B at a 0.5 ml/minute flowrate and protein was detected by absorbance at 280 nm. Fractions containing p38 kinase (detected by SDS-polyacrylamide gel electrophoresis) were pooled and frozen at -80 °C. Typical purified protein yields from 5 L *E. coli* shake flasks fermentations were 35 mg p38 kinase.

In Vitro Assay

The ability of compounds to inhibit human p38 kinase alpha was evaluated using two in vitro assay methods. In the first method, activated human p38 kinase alpha phosphorylates a biotinylated substrate, PHAS-I (phosphorylated heat and acid stable protein-insulin inducible), in the presence of gamma ^{32}P -ATP (^{32}P -ATP). PHAS-I was biotinylated prior to the assay and provides a means of capturing the substrate which is phosphorylated during the assay. p38 Kinase was activated by MKK6. Compounds were tested in 10 fold serial dilutions over the range of 100 μM to 0.001 μM using 1% DMSO. Each concentration of inhibitor was tested in triplicate.

All reactions were carried out in 96 well polypropylene plates. Each reaction well contained 25 mM HEPES pH 7.5, 10 mM magnesium acetate and 50 μM unlabeled ATP. Activation of p38 was required to achieve sufficient signal in the assay. Biotinylated PHAS-I was used at 1-2 μg per 50 μl reaction volume, with a final concentration of 1.5 μM . Activated human p38 kinase alpha was used at 1 μg per 50 μl reaction volume representing a final concentration of 0.3 μM . Gamma ^{32}P -ATP was used to follow the phosphorylation of PHAS-I. ^{32}P -ATP has a specific activity of 3000 Ci/mmol and was used at 1.2 μCi per 50 μl reaction volume. The reaction proceeded either for one hour or overnight at 30 $^{\circ}\text{C}$.

Following incubation, 20 μl of reaction mixture was transferred to a high capacity streptavidin coated filter plate (SAM-streptavidin-matrix, Promega) prewetted with phosphate buffered saline. The transferred reaction mix was allowed to contact the streptavidin membrane of the Promega plate for 1-2 minutes. Following capture of biotinylated PHAS-I with ^{32}P incorporated, each well was washed to remove unincorporated ^{32}P -ATP three times with 2M NaCl, three washes of 2M NaCl with 1% phosphoric, three washes of distilled water and finally a single wash

of 95% ethanol. Filter plates were air dried and 20 μ l of scintillant was added. The plates were sealed and counted. Results are shown in Table 4.

A second assay format was also employed that is based on p38 kinase alpha induced phosphorylation of EGFRP (epidermal growth factor receptor peptide, a 21 mer) in the presence of ^{33}P -ATP. Compounds were tested in 10 fold serial dilutions over the range of 100 μM to 0.001 μM in 10% DMSO. Each concentration of inhibitor was tested in triplicate. Compounds were evaluated in 50 μ l reaction volumes in the presence of 25 mM Hepes pH 7.5, 10 mM magnesium acetate, 4% glycerol, 0.4% bovine serum albumin, 0.4mM DTT, 50 μM unlabeled ATP, 25 μg EGFRP (200 μM), and 0.05 uCi gamma ^{33}P -ATP. Reactions were initiated by addition of 0.09 μg of activated, purified human GST-p38 kinase alpha. Activation was carried out using GST-MKK6 (5:1,p38:MKK6) for one hour at 30 $^{\circ}\text{C}$ in the presence of 50 μM ATP. Following incubation for 60 minutes at room temperature, the reaction was stopped by addition of 150 μ l of AG 1X8 resin in 900 mM sodium formate buffer, pH 3.0 (1 volume resin to 2 volumes buffer). The mixture was mixed three times with pipetting and the resin was allowed to settle. A total of 50 μ l of clarified solution head volume was transferred from the reaction wells to Microlite-2 plates. 150 μ l of Microscint 40 was then added to each well of the Microlite plate, and the plate was sealed, mixed, and counted.

TNF Cell Assays

25 Method of Isolation of Human Peripheral Blood Mononuclear Cells:

Human whole blood was collected in Vacutainer tubes containing EDTA as an anticoagulant. A blood sample (7 ml) was carefully layered over 5 ml PMN Cell Isolation Medium (Robbins Scientific) in a 15 ml round bottom centrifuge tube. The sample was centrifuged at 450-500 x g for 30-35 minutes in a swing out rotor at room temperature. After centrifugation, the top band of cells were removed and washed 3 times with PBS w/o calcium or magnesium. The cells were centrifuged at 400 x g for 10 minutes at room temperature. The cells were resuspended in Macrophage Serum Free Medium (Gibco BRL) at a concentration of 2 million cells/ml.

40 LPS Stimulation of Human PBMs:

PBM cells (0.1 ml, 2 million/ ml) were co-incubated with 0.1 ml compound (10-0.41 μ M, final concentration) for 1 hour in flat bottom 96 well microtiter plates.

100430 120704
FOI 0342001

Compounds were dissolved in DMSO initially and diluted in TCM for a final concentration of 0.1% DMSO. LPS (Calbiochem, 20 ng/ml, final concentration) was then added at a volume of 0.010 ml. Cultures were incubated overnight at 37 °C. Supernatants were then removed and tested by ELISA for TNF- α and IL1- β . Viability was analyzed using MTS. After 0.1 ml supernatant was collected, 0.020 ml MTS was added to remaining 0.1 ml cells. The cells were incubated at 37 °C for 2-4 hours, then the O.D. was measured at 490-650 nm.

Maintenance and Differentiation of the U937 Human Histiocytic Lymphoma Cell Line:

U937 cells (ATCC) were propagated in RPMI 1640 containing 10% fetal bovine serum, 100 IU/ml penicillin, 100 μ g/ml streptomycin, and 2 mM glutamine (Gibco). Fifty million cells in 100 ml media were induced to terminal monocytic differentiation by 24 hour incubation with 20 ng/ml phorbol 12-myristate 13-acetate (Sigma). The cells were washed by centrifugation (200 x g for 5 min) and resuspended in 100 ml fresh medium. After 24-48 hours, the cells were harvested, centrifuged, and resuspended in culture medium at 2 million cells/ml.

LPS Stimulation of TNF production by U937 Cells:

U937 cells (0.1 ml, 2 million/ml) were incubated with 0.1 ml compound (0.004-50 μ M, final concentration) for 1 hour in 96 well microtiter plates. Compounds were prepared as 10 mM stock solutions in DMSO and diluted in culture medium to yield a final DMSO concentration of 0.1% in the cell assay. LPS (E coli, 100 ng/ml final concentration) was then added at a volume of 0.02 ml. After 4 hour incubation at 37°C, the amount of TNF- α released in the culture medium was quantitated by ELISA. Inhibitory potency is expressed as IC50 (μ M). Results of these TNF Cell Assays are shown in Table 5.

TNF Inhibition: Human Whole Blood Assay

Human peripheral blood is obtained in heparinized tubes. A 190 μ L aliquot of blood is placed in each well of a 96 well u-bottom plate. A compound or control vehicle (phosphate buffered saline with dimethylsulfoxide and ethanol) is added to the blood in 10 μ L aliquots for serial dilutions providing final concentrations of 25, 5, 1 and 0.25 μ M. The final dimethylsulfoxide and ethanol concentrations are 0.1% and 1.5%, respectively. After one hour of incubation at 37 °C, 10 mL of lipopolysaccharide (*Salmonella typhosa*, Sigma) in phosphate buffered saline is added resulting in a final concentration of 10 mg/mL. After four to five hours of incubation at 37 °C, the supernatants are harvested and assayed at 1:10 or 1:20 dilutions for human TNF using ELISA.

Rat Assay

The efficacy of the novel compounds in blocking the production of TNF also was evaluated using a model based on rats challenged with LPS. Male Harlan Lewis rats [Sprague Dawley Co.] were used in this model. Each rat weighed approximately 300 g and was fasted overnight prior to testing. Compound administration was typically by oral gavage (although intraperitoneal, subcutaneous and intravenous administration were also used in a few instances) 1 to 24 hours prior to the LPS challenge. Rats were administered 30 μ g/kg LPS [salmonella typhosa, Sigma Co.] intravenously via the tail vein. Blood was collected via heart puncture 1 hour after the LPS challenge. Serum samples were stored at -20 °C until quantitative analysis of TNF- α by Enzyme Linked-Immuno-Sorbent Assay ("ELISA") [Biosource]. Additional details of the assay are set forth in Perretti, M., et al., Br. J. Pharmacol. (1993), 110, 868-874, which is incorporated by reference in this application.

Mouse Assay

Mouse Model Of LPS-Induced TNF Alpha Production:

TNF alpha was induced in 10-12 week old BALB/c female mice by tail vein injection with 100 ng lipopolysaccharide (from S. Typhosa) in 0.2 ml saline. One hour later mice were bled from the retroorbital sinus and TNF concentrations in serum from clotted blood were quantified by ELISA. Typically, peak levels of serum TNF ranged from 2-6 ng/ml one hour after LPS injection.

The compounds tested were administered to fasted mice by oral gavage as a suspension in 0.2 ml of 0.5% methylcellulose and 0.025% Tween 20 in water at 1 hour or 6 hours prior to LPS injection. The 1 hour protocol allowed evaluation of compound potency at Cmax plasma levels whereas the 6 hour protocol allowed estimation of

1002480-120704

compound duration of action. Efficacy was determined at each time point as percent inhibition of serum TNF levels relative to LPS injected mice that received vehicle only.

- Additional results obtained using the above-
- 5 described assays are set forth in Table 6 below. p38 assay and U937 cell assay results are expressed as IC_{50} (μ m). Mouse-LPS assay results are expressed as percent inhibition.

Induction And Assessment Of Collagen-Induced Arthritis In Mice:

Arthritis was induced in mice according to the procedure set forth in J.M. Stuart, Collagen Autoimmune Arthritis, Annual Rev. Immunol. 2:199 (1984), which is incorporated herein by reference. Specifically, arthritis was induced in 8-12 week old DBA/1 male mice by injection of 50 μ g of chick type II collagen (CII) (provided by Dr. Marie Griffiths, Univ. of Utah, Salt Lake City, UT) in complete Freund's adjuvant (Sigma) on day 0 at the base of the tail. Injection volume was 100 μ l. Animals were boosted on day 21 with 50 μ g of CII in incomplete Freund's adjuvant (100 μ l volume). Animals were evaluated several times each week for signs of arthritis. Any animal with paw redness or swelling was counted as arthritic. Scoring of arthritic paws was conducted in accordance with the procedure set forth in Wooley et al., Genetic Control of Type II Collagen Induced Arthritis in Mice: Factors Influencing Disease Susceptibility and Evidence for Multiple MHC Associated Gene Control., Trans. Proc., 15:180 (1983). Scoring of severity was carried out using a score of 1-3 for each paw (maximal score of 12/mouse). Animals displaying any redness or swelling of digits or the paw were scored as 1. Gross swelling of the whole paw or deformity was scored as 2. Ankylosis of joints was scored as 3. Animals were evaluated for 8 weeks. 8-10 animals per group were used.

Preparation And Administration Of Compounds:

The compounds tested on mice having collagen-induced arthritis were prepared as a suspension in 0.5% methylcellulose (Sigma, St. Louis, MO), 0.025% Tween 20 (Sigma). The compound suspensions were administered by oral gavage in a volume of 0.1 ml b.i.d. Administration began on day 20 post collagen injection and continued

daily until final evaluation on day 56. Scoring of arthritic paws was conducted as set forth above. Assay results are set forth in Table 7.

invention may be administered by any suitable route,
preferably in the form of a pharmaceutical composition
adapted to such a route, and in a dose effective for the
15 treatment intended. The active compounds and composition
may, for example, be administered orally, intravascularly
(IV), intraperitoneally, subcutaneously, intramuscularly
(IM) or topically. For oral administration, the
pharmaceutical composition may be in the form of, for
20 example, a tablet, hard or soft capsule, lozenges,
dispensable powders, suspension or liquid. The
pharmaceutical composition is preferably made in the form
of a dosage unit containing a particular amount of the
active ingredient. Examples of such dosage units are
25 tablets or capsules. The active ingredient may also be
administered by injection (IV, IM, subcutaneous or jet)
as a composition wherein, for example, saline, dextrose,
or water may be used as a suitable carrier. The pH of
the composition may be adjusted, if necessary, with
30 suitable acid, base, or buffer. Suitable bulking,
dispersing, wetting or suspending agents, including
mannitol and PEG 400, may also be included in the
composition. A suitable parenteral composition can also
include a compound formulated as a sterile solid
35 substance, including lyophilized powder, in injection
vials. Aqueous solution can be added to dissolve the

1002490-120701

compound prior to injection. The amount of therapeutically active compounds that are administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the severity of the inflammation or inflammation related disorder, the route and frequency of administration, and the particular compound employed, and thus may vary widely. The pharmaceutical compositions may contain active ingredients in the range of about 0.1 to 1000 mg, preferably in the range of about 7.0 to 350 mg. A daily dose of about 0.01 to 100 mg/kg body weight, preferably between about 0.1 and about 50 mg/kg body weight and most preferably between about 0.5 to 30 mg/kg body weight, may be appropriate. The daily dose can be administered in one to four doses per day. In the case of skin conditions, it may be preferable to apply a topical preparation of compounds of this invention to the affected area two to four times a day. For disorders of the eye or other external tissues, e.g., mouth and skin, the formulations are preferably applied as a topical gel, spray, ointment or cream, or as a suppository, containing the active ingredients in a total amount of, for example, 0.075 to 30% w/w, preferably 0.2 to 20% w/w and most preferably 0.4 to 15% w/w. When formulated in an ointment, the active ingredients may be employed with either paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example at least 30% w/w of a polyhydric alcohol such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol, polyethylene glycol and mixtures thereof. The topical formulation may desirably include a compound which enhances absorption or penetration of the active

1004980-4094

ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogs. The compounds of this invention can also be administered by a transdermal device. Preferably topical administration will be accomplished using a patch either of the reservoir and porous membrane type or of a solid matrix variety. In either case, the active agent is delivered continuously from the reservoir or microcapsules through a membrane into the active agent permeable adhesive, which is in contact with the skin or mucosa of the recipient. If the active agent is absorbed through the skin, a controlled and predetermined flow of the active agent is administered to the recipient. In the case of microcapsules, the encapsulating agent may also function as the membrane. The transdermal patch may include the compound in a suitable solvent system with an adhesive system, such as an acrylic emulsion, and a polyester patch. The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier, it may comprise a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make-up the so-called emulsifying wax, and the wax together with the oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations. Emulsifiers and emulsion stabilizers suitable for use in the formulation of the present invention include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate, and sodium lauryl sulfate, among others. The choice of suitable oils or fats for the formulation

FOI b7D b7C b7E

is based on achieving the desired cosmetic properties, since the solubility of the active compound in most oils likely to be used in pharmaceutical emulsion formulations is very low. Thus, the cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters may be used. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils can be used. Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredients are dissolved or suspended in suitable carrier, especially an aqueous solvent for the active ingredients. The anti-inflammatory active ingredients are preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% and particularly about 1.5% w/w. For therapeutic purposes, the active compounds of this combination invention are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. If administered *per os*, the compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanolic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, gelatin, acacia gum, sodium alginate, polyvinylpyrrolidone, and/or polyvinyl alcohol, and then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation as may be provided in a dispersion of active

40021780-420701

compound in hydroxypropylmethyl cellulose. Formulations for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and
5 suspensions may be prepared from sterile powders or granules having one or more of the carriers or diluents mentioned for use in the formulations for oral administration. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil,
10 cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art.

Description of parallel array synthesis methodology utilized to prepare compounds of Examples B-i, B-ii, and B-iii.

5

- Scheme B-1 describes the parallel array reaction blocks that were utilized to prepare compounds of Examples B-0001 through B-1574, and by analogy could also be used to prepare compounds of Examples B-1575 through B-2269.
- 10 Parallel reactions were performed in multi-chamber reaction blocks. A typical reaction block is capable of performing 48 parallel reactions, wherein a unique compound is optionally prepared in each reaction vessel B1. Each reaction vessel B1 is made of either
- 15 polypropylene or pyrex glass and contains a frit B2 toward the base of the vessel. Each reaction vessel is connected to the reaction block valve assembly plate B3 via leur-lock attachment or through a threaded connection. Each vessel valve B4 is either opened or
- 20 closed by controlling the leur-lock position or by the opening or closing of levers B5 within a valve assembly plate row. Optionally, solutions can be either drained or maintained above the vessel frits by leaving the valves in the opened position and controlling the back
- 25 pressure beneath the valve assembly plate by control of inert gas flow through the inert gas inlet valve B6. The parallel reactions that are performed in these reaction blocks are allowed to progress by incubation in a jacketed, temperature controlled shaking station.
- 30 Temperature control of the reaction chambers is effected by passing a heat-transfer liquid through jacketed aluminum plates that make contact with the reaction block

Scheme B-2 illustrates the various utilizations of functionalized resins to purify reaction vessel products B22 prior to filtration from the fritted vessels B1 into collection vials B9. Said functionalized resins perform as 1) resin-bound reagents B12, which give rise to resin-bound reagent byproducts B13; 2) sequestrants B14 or B15 of excess solution-phase reactants B16 or B17, respectively. Solution-phase reactants B16 and B17 contain inherent reactive functionality $-rf_1$ and $-rf_2$

which enable their chemoselective sequestration by the complementary reactive functionality -Crf₁ and -Crf₂, attached to resins B14 and B15; 3) sequestrants B18 of solution-phase byproducts B19. Byproduct B19 contains
5 molecular recognition functionality -mr₂, which enables its chemoselective sequestration by the complementary functionality -Cmr₂, attached to resin B18; 4) reaction-quenching resins B20 which give rise to quenched resins B21. Resin B20 contains functionality -Q which mediates
10 reaction quenching (for instance, proton transfer) of product B22 to form a desired isolable form of product B22. Upon performing reaction quench, the resin B20 is converted to resin B21 wherein -q represents the spent functionality on resin B21 ; 5) sequestrants B23 of
15 chemically-tagged reagents B24 and their corresponding reagent byproducts B25. The soluble reagent B24 contains a bifunctional chemical group, -tag, which is inert to the reaction conditions but is used to enable the post-reaction sequestration of B24 by the complementary
20 functionality -Ctag attached to resin B23. Additionally, the soluble reagent byproduct B25, formed during the course of reaction, contains the same chemical function -tag that also enables its sequestration by resin B23. Additionally, some reactants B16, particularly
25 sterically-hindered reactants and/or electron deficient nucleophiles, contain poorly sequestrable functionality (rf1 in this case is a poorly sequestable functionality). These poorly sequestable reactants B16 can be transformed in situ to more robustly sequestrable species B27 through
30 their reaction with sequestration-enabling-reagents B26. B26 contain highly reactive, complementary functionality Crf₁, which reacts with B16 to form B27 in situ. The

10024780-120701

bifunctional molecular recognition functionality, mr , contained within B26 is also present on the in situ derivatized B27. Both B26 and B27 are sequestered by the complementary molecular recognition functionality attached to resin B28. By analogy, some reactions contain poorly sequesterable byproducts B19, wherein the molecular recognition functionality mr , in this case is not able to mediate the direct sequestration of B19 by the complementary functionality attached to resin B18.

10 Similar use of the bifunctional sequestration-enabling-reagent B29 transforms B19 into the more readily sequesterable species B30. The imparted molecular recognition functionality, mr , present in B30 is readily sequestered by the complementary functionality, Cmr , attached to resin B31. In some reactions, multiple sequestration resins are utilized simultaneously to perform reaction purifications. Even resins containing incompatible (mutually reactive) functional groups can be used simultaneously because these resins scavenge

20 complementary functionalized solution phase reactants, reagents, or byproducts from solution phase faster than resin cross-neutralization. Similarly, resins containing mutually reactive or neutralizing reaction-quenching functionality are able to quench solution phase

25 reactants, products, or byproducts faster than resin cross-neutralization.

Scheme B3 describes the modular robotics laboratory environment that was utilized to prepare compounds of Examples B0001 through Bxxxx. Chemicals that are utilized in the robotics laboratory are weighed and then dissolved or suspended into solvents at Station #1 (Automated Chemistry Prep Station). Thus, solutions or suspensions of known molarity are prepared for use at the other robotics workstations. Station #1 also optionally bar-code labels each chemical solution so that its identity can be read by bar-code scanning at this and other robotics workstations.

Reactions are initiated at the modular Stations #2 and #2 DUP. Station #2DUP is defined as a duplicate of Station #2 and is used to increase capacity within the robotics laboratory. A reaction block is mounted at Station #2 or #2 DUP. Also, racks containing reactants, reagents, solvents, and resin slurries are also mounted at Station #2 or #2 DUP. Under the control of a chemical

informatics mapping file, reactions are initiated by the transfer of reactant solutions, reagent solutions, solvents, and/or resin slurries into each mounted reaction block vessel. The transfer of known volumes of solutions, suspensions, or solvents is mediated by syringes which control a one-up septum piercing/argon purging cannula, a wide-bore resin slurry-despensing cannula, or by a six-up cannula which can simultaneously deliver volumes to a row of six reaction vessels. The reaction block and/or chemical solution racks may be optionally cooled below room temperature during the chemical solution transfer operations. After the transfer of chemical solutions and solvents has been performed by Station#2 or #2DUP, incubation of the reaction block may occur while the reaction block is mounted at the robot station. Preferably, however, the reaction block is removed after all volume transfers are complete and the reaction block is brought to ambient temperature. The reaction block is transferred off-line to either a vertical- or lateral shaking Incubator Station #5.

The Automated weighing/archival Station #3 performs the functions of weighing empty collection vials (to obtain tare weights of collection vials) and also performs the functions of weighing collection vials containing filtered, purified products (to obtain gross weights of collection vials). After product-containing collection vials have been weighed (gross weight determinations) at workstation #3, the collection vial products are optionally redissolved into an organic solvent at workstation #3. Transfer of solvents is accomplished with syringes which control a mounted one-up septum-piercing/argon purging cannula. Each product-containing

10024780-120704

collection vial is prepared as a solution of known molarity as directed and recorded by the chemical informatics system. These product solutions may be subsequently mounted at Station #2 or #2DUP for subsequent reaction steps or taken to Station #7 or #7DUP for analytical processing.

Rapid solvent evaporation of product-containing collection vials is accomplished by mounting the collection racks at Savant Automated Solvent Evaporation Stations #4, #4 DUP, or #4 TRIP, wherein #4DUP and #4TRIP are defined as a duplicate and a triplicate of Station #4 to increase the capacity for solvent removal within the robotics laboratory. Commercially available solvent removal stations were purchased from the Savant Company (model # SC210A speedvac unit equipped with model # RVT4104 vapor trap and model # VN100 vapornet cryopump).

Stations #7 and #7DUP perform analytical processing functions. Station #7DUP is defined as a duplicate of Station #7 to increase capacity within the robotics laboratory. Product-containing collection racks are mounted at either of these stations. Each product-containing collection vial is then prepared as a solution of known molarity as directed and recorded by the chemical informatics mapping file. Optionally, this dissolution function is performed by prior processing of the collection vial rack at Station #3 as described above. Station#7 or #7DUP, under the control of the chemical informatics mapping file, transfers aliquots of each product vial into unique and identifiable microtiter plate wells that are utilized to perform analytical determinations.

10021780-120701

One such microtiter plate is prepared at Station #7 or #7DUP for subsequent utilization at the Automated HPLC/Mass Spectrometer Station #8 or #8DUP. Station #8DUP is a duplicate of Station #8 to increase the analytical capacity of the robotics laboratory. Stations #8 and #8DUP are commercially available benchtop LC/Mass spec units purchased from Hewlett Packard (model HP1100 HPLC connected to HP1100 MSD (G1946A) mass spectrometer; this unit is also equipped with a model# G1322A solvent degasser, model # G1312A binary pump, a model # G1316A column heater, and a model # G1315A diode array detector. The HP unit has been interfaced with a commercially available autosampler rack (Gilson Company # 215 autosampler). Station #8 or #8DUP is utilized for the determination of product purity and identity by performing high performance liquid chromatography (HPLC) and companion atmospheric pressure chemi-ionization (APCI) or electrospray mass spectrometry for molecular weight determination.

Another microtiter plate is prepared at Station #7 or #7DUP for subsequent utilization at a commercially available flow-probe Varian NMR spectrometer Station #10 (Varian Instruments flow probe NMR, 300 MHz, interfaced with a commercially available Gilson 215 autosampler). Proton, ¹³-Carbon, and/or ¹⁹-Fluorine NMR spectra are determined at this Station #10.

Other microtiter plates are optionally mounted at Station #7 or #7DUP for the purpose of preparing product-containing plates for biological assays. Aliquots of product-containing collection vials are transferred to these biological assay microtiter plates under the control of the chemical informatics mapping file. Identity and amount of each transferred product is

10021780-120704

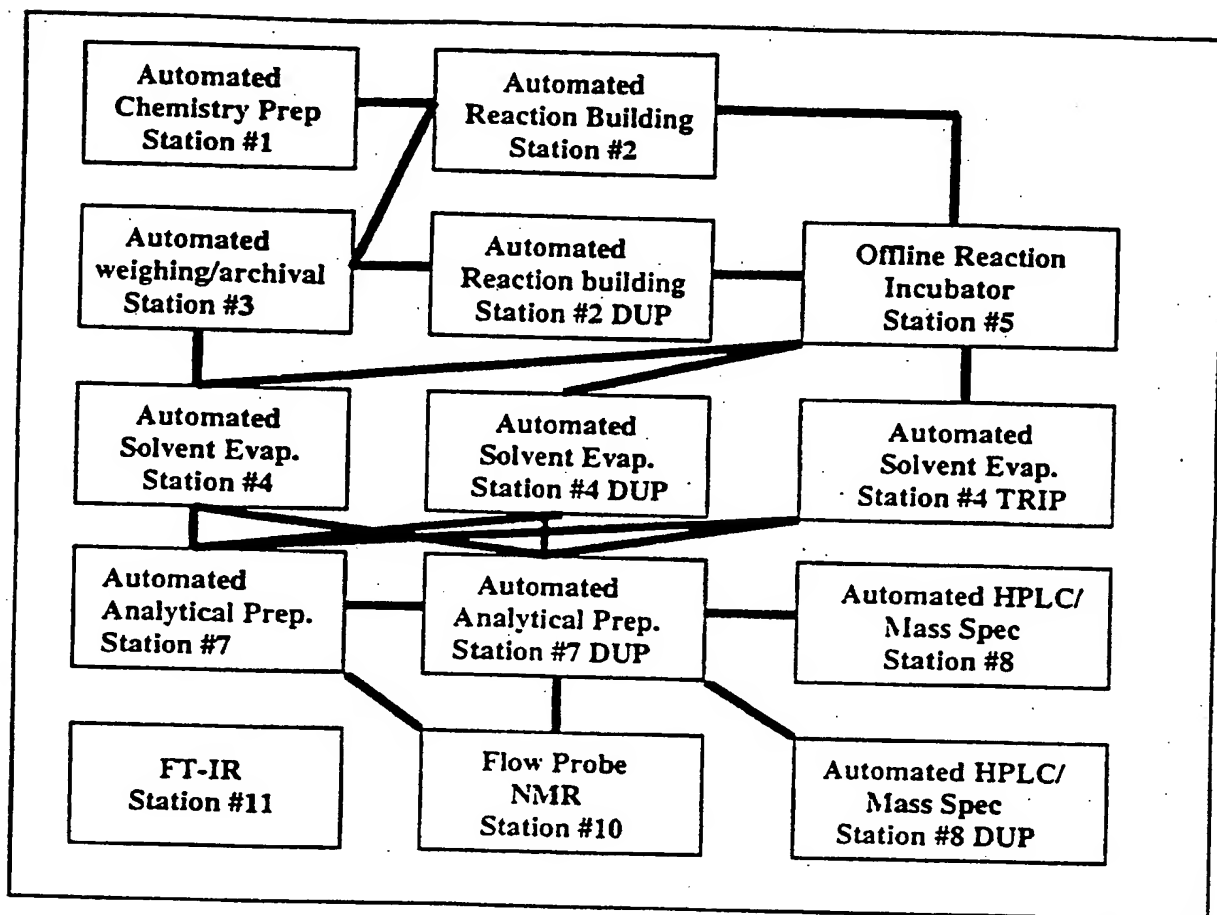

recorded by the chemical informatics system for retrieval by biologists who perform the biological assaying of products.

- 5 The Fourier Transform InfraRed (FT-IR) Spectrometer Station #11 is utilized to analyze resins for the identity of organic functional groups chemically attached to these resins. The resins, as mentioned above, contain chemical functionality utilized as reagents, chemoselective sequestrants, or reaction quenching media for the workup and purification of the crude product mixtures contained within reaction block vessels. The robotics laboratory utilizes a commercially available FT-IR spectrometer purchased from Nicolet Instruments (model # MagnaIR 560 interfaced with an InspectIR microscope for resin mounting and positioning).

10021780-120704

The ChemLib IT system is a composite of software running on the client's desktop and software running on a remote server.

The ChemLib IT system is a client/server software application developed to support and document the data handling flow in the robotics laboratory described above. This IT system integrates the chemist with the robotics synthesis laboratory and manages the data generated by this processes.

The software running on the server warehouses all the electronic data for the robotics chemistry unit. This

server, a Silicon Graphics IRIX station v6.2, runs the database software, Oracle 7 v7.3.3.5.0, that warehouses the data. Connection from the client's desktop to the server is provided by Oracle's TCP/IP Adapter v2.2.2.1.0 and SQL*Net v2.2.2.1.0A. SQL*Net is Oracle's network interface that allows applications running on the client's desktop to access data in Oracles' database.

The client's desktop is Microsoft Windows 95. The ChemLib IT system client software is composed of Omnis7 v3.5 and Microsoft Visual C++ v5.0. This composition on the client side is what is herein referred to as ChemLib. ChemLib communicates with the server for its data via Oracle's PL/SQL v2.3.3.4.0. These PL/SQL calls within ChemLib creates a network socket connection to Oracle's SQL*Net driver and the TCP/IP Adapter thereby allowing access to the data on the server.

A "library" is defined as a composite number of wells, where each well defines a single compound. ChemLib defines a library in a module called the *Electronic Spreadsheet*. The *Electronic Spreadsheet* is then a composite of n-number of wells containing the components that are required to synthesize the compound that exist in each these well(s).

The chemist begins by populating the *Electronic Spreadsheet* with those components required for the compound synthesis. The identity and the availability of these components are defined in the *Building Block Catalog* module of ChemLib. The *Building Block Catalog* is a catalog of a listing of all reagents, solvents, peripherals available in the robotics laboratory. Upon selecting the components for each compound we also

declare the quantity of each component to be utilized. The quantity of each component can be identified by its molarity and volumetric amounts (ul) or by it's solid state form (mg). Therefore a well in the *Electronic Spreadsheet* defines a compound that is identified by its components and the quantity of each of these components.

The assembly or the synthesis of these components for each compound in the *Electronic Spreadsheet* is defined in the *WS Sequence* module of ChemLib. The *Define WS Sequence* module identifies the synthesis steps to be performed at the robotics workstations and any activities to be performed manually or off-line from the robotics workstation. With this module we identify which components from the *Electronic Spreadsheet* and the activity that should be performed with this component in the robotics laboratory. In the *Define WS Sequence* module the chemist chooses from a list of activities to be performed in the robotics laboratory and assembles them in the order in which they are to occur. The ChemLib system takes these set of activities identified, and with the component data in the *Electronic Spreadsheet* assembles and reformats these instructions into terminology for the robotics workstation use. This robotics terminology is stored in a 'sequence' file on a common server that is accessible by the robotics workstation.

The robotics workstation performs the synthesis in a reaction block apparatus as described. Each well in the *Electronic Spreadsheet* is tracked and mapped to a unique location in the reaction block apparatus on the robotics workstation. The compound or product synthesized at the

10021780-120701

robotics workstation in the reaction block is then captured into collection vials.

5 The collection vials are first tarred then grossed on the robotics workstation after collecting their products from the reaction block. These weights (tare and gross) are recorded into the ChemLib system with the *Tare/Gross Session* module. The *Tare/Gross Session* module then calculates the product or compound yields and its final
10 mass.

Preparation of the compound for analytical analysis and screening is defined by the *Analytical WS Setup* module in ChemLib. The *Analytical WS Setup* module identifies the
15 dilution factor for each well in the *Electronic Spreadsheet*, based on the compound's product yield and the desired molar concentration. This identifies the quantity, in uL, to be transferred at the robotics workstation, to a specific location on the MTP
20 (microtiter plate) to be sent for analysis and/or biological assaying. The mass spectrometric and HPLC results for each well are recorded and scored into the ChemLib system.

25 The *Dilute/Archive WS* module further identifies each compound by mapping the compound's well from the *Electronic Spreadsheet* to a specific MX block location for long term storage and archival as part of the registration process.

30 All communications between ChemLib and the robotics workstations are by ASCII files. These files are placed on a server by the ChemLib system that is accessible by

10021780-120701
TOTAL=08472001

the robotics workstations. Reports generated by the robotics workstations are also placed on the server where the ChemLib system can read these files to record the data generated. Each robotics workstation consists of robotics hardware by Bohdan Automation, Inc. Mundelein, Illinois, and a PC currently running Microsoft Windows for Workgroup v3.11 and Ethernet software. The robotics workstation PC is logged into the network for one-way communication that allows the workstation to access the server for file access only.

General Scheme B4

Scaffold C-i with a primary amine functionality contained within the R^i substituent is reacted in spatially addressed, parallel array reaction block vessels with excess of electrophiles R^j-Q wherein Q is chloro, bromo, or an acid activating group including but not limited to N-hydroxysuccinimide. R^j-Q includes acid chlorides, alkyl chloroformates, sulfonyl chlorides, activated esters of carboxylic acids, activated carbamates, and isocyanates. Reaction of scaffold C-i with R^j-Q is effected in the presence of a tertiary amine base at room temperature in a mixture of a polar aprotic solvent and/or a halogenated solvent. As illustrated in Scheme B-4 the products of the general formulae B-i are isolated in purified form by addition of a carbonyl-functionalized resin B32 which covalently sequesters any unreacted primary amine scaffold C-i as resin-bound adduct B35, and also by the addition of a primary amine-functionalized resin B33 which covalently sequesters any remaining electrophile R^j-Q from each reaction mixture as
